#### Abstract

The existence of multiple centrosomes in some cancer cells can lead to cell death through the formation of multipolar mitotic spindles and consequent aberrant cell division. Many cancer cells rely on HSET (KIFC1) to cluster the extra centrosomes into two groups to mimic the bipolar spindle formation of non-centrosome-amplified cells and ensure their survival. Here, we report the discovery of a novel 2-(3-benzamidopropanamido)thiazole-5-carboxylate with micromolar  in vitro inhibition of HSET (KIFC1) through high-throughput screening and its progression to ATP-competitive compounds with nanomolar biochemical potency and high selectivity against the opposing mitotic kinesin Eg5. Induction of the multipolar phenotype was shown in centrosome-amplified human cancer cells treated with these inhibitors. In addition, a suitable linker position was identified to allow the synthesis of both fluorescent- and trans-cyclooctene (TCO)-tagged probes, which demonstrated direct compound binding to the HSET protein and confirmed target engagement in cells, through a click-chemistry approach.

## INTRODUCTION

The human spleen, embryo, and testes protein (HSET), also known as KIFC1 or kinesin-14a, is a member of the kinesin-14 motor protein family. ${ }^{1}$ Like other kinesin motor proteins, HSET consists of a microtubule binding domain (MBD), a coiled-coil stalk, and a motor domain at the C-terminus. ${ }^{2}$ HSET forms homodimers with an antiparallel orientation of the individual proteins so that the MBDs are located at either end of the dimer. In turn, HSET dimers cross-link parallel and antiparallel microtubules (MTs) in the cellular mitotic spindle. The opposing orientations of the MBDs enable the kinesin motor to slide antiparallel MTs relative to the parallel MTs due to the directional movement of each individual HSET protein toward the minus ends of the MTs in an ATP hydrolysis-dependent manner. ${ }^{2,3}$

During mitosis, the assembly of a bipolar mitotic spindle is required to allow an equal partition of the replicated chromosomes into the daughter cells and avoid deleterious and typically lethal multipolar cell division. ${ }^{4}$ In some cancer cells, multiple microtubule organizing centers (MTOCs) are present due to the existence of multiple centrosomes, which can impair the bipolar spindle assembly and thus lead to uneven separation of the chromosomes, multipolar divisions, mitotic catastrophe, and eventually cell death. ${ }^{5,6}$ To overcome this
vulnerability, many cancer cells rely on HSET to cluster the extra centrosomes into two groups to mimic the bipolar spindle formation of non-centrosome-amplified cells and ensure their survival. ${ }^{7,8}$ In contrast, as previous studies have found, HSET is not required for the assembly of the correct spindle architecture during the mitosis of non-centrosome-amplified cells. Other mitotic kinesins, notably Eg5, act to separate MTOCs and therefore oppose the clustering action of HSET. ${ }^{3}$

Inhibiting HSET could provide a treatment to target tumors with a high content of cells with amplified centrosomes without affecting normal tissue. ${ }^{3}$ In particular, HSET may be a potential target in breast cancers with high centrosome amplification. ${ }^{9-11}$ In addition to its important role in maintaining mitotic spindle integrity in centrosome-amplified cells, HSET is involved in spermatogenesis in mammalian species. ${ }^{12}$ HSET has also been shown to be expressed in nondividing human neurons, where it is implicated in maintaining MT-dependent axon structures. ${ }^{13}$

The mean concentration observed at $50 \%$ inhibition was $13 \mu \mathrm{M}$.

There is a need to develop and comprehensively characterize potent HSET inhibitors from diverse scaffolds to provide tools for therapeutic research. A small number of HSET inhibitors with cellular activity have been reported. ${ }^{14-17}$ Of these, AZ82 ${ }^{18}$ (1, Tables 1 and 2, Figure S4), is a potent, reversible inhibitor of the HSET motor domain in biochemical assays, while others have been characterized primarily by their potent cellular activities. ${ }^{16,17,19}$ Kinesin motor proteins present several opportunities for inhibition with small molecules, either through direct or allosteric competition for ATP substrate binding or through interference with microtubule binding. ${ }^{14}$ In view of the multiple ways in which a HSET inhibitory phenotype could be reached in cells, it is desirable to link biochemical and cellular activities through assays demonstrating direct target engagement in both cellular and cell-free systems. ${ }^{20}$ In this work, we describe the discovery of a new HSET inhibitor series from highthroughput biochemical screening and its initial medicinal chemistry optimization to potent cell-permeable inhibitors. In parallel, we show how the compounds were engineered to provide probe molecules to demonstrate HSET binding in vitro and cellular target engagement through the observation of the colocalization of a trans-cyclooctene (TCO)-tagged inhibitor and HSET in human cancer cells.

## RESULTS AND DISCUSSION

A high-throughput screen was carried out using the ADP-Glo format to detect the inhibition of microtubule-stimulated HSET ATPase activity, ${ }^{21}$ from which the commercial compound 2 (CCT341932) (Table 1) was identified as one hit of interest. Both newly purchased and resynthesized batches of 2 confirmed the activity, with a HSET $\mathrm{IC}_{50}$ of $2.7 \mu \mathrm{M}$. The screening conditions for the ADP-Glo assay used an ATP concentration of $3 \mu \mathrm{M}$. When the assay was conducted with a higher ATP concentration of $150 \mu \mathrm{M}$, a reduced potency for 2 was observed (HSET $\mathrm{IC}_{50}$ of $7.1 \mu \mathrm{M}$ ), suggesting the compound is competitive with ATP. We also examined the potential for 2 to inhibit Eg5, a plus-end-directed mitotic kinesin. Counterscreening against Eg5 is important, as this kinesin opposes the action of HSET in clustering centrosomes and the off-target inhibition of Eg5 may confound the interpretation of cellular effects. ${ }^{3}$ We therefore established an equivalent ADP-Glo assay for microtubule-stimulated Eg 5 motor domain activity and demonstrated only $10 \%$ inhibition at a top concentration of 200 $\mu \mathrm{M} 2$, indicating significant biochemical selectivity for HSET over Eg5. Based on these promising biochemical data and the acceptable ligand efficiency ( $\mathrm{LE}=0.30$ ) and lipophilic ligand efficiency ( $L L E=2.5$ ) of 2, the compound was taken forward to investigate structure-activity relationships (SARs).

Although crystal structures of the HSET motor domain containing adenosine diphosphate (ADP) are available, ${ }^{18,22}$ none containing a bound HSET inhibitor have been reported.

Table 2. In Vitro Inhibition of HSET and Ligand Efficiencies of 13 and 19-32

${ }^{a}$ Inhibition of recombinant full-length HSET with preformed microtubules and $3 \mu \mathrm{M} \mathrm{ATP}$ measured in ADP-Glo format, mean ( $\pm$ SD) for $n \geq 3$ atoms. ${ }^{b}$ Ligand efficacy was calculated using $\mathrm{LE}=-1.4 \log \left(\mathrm{IC}_{50}[\mathrm{M}]\right) /$ number of non-hydrogen atoms. ${ }^{c}$ Lipophilic ligand efficacy was determined using the equation $\operatorname{LLE}=-\log \left(\mathrm{IC}_{50}[\mathrm{M}]\right)-\mathrm{cLog} P$, where $\mathrm{cLog} P$ was calculated using MoKa from Molecular Discovery. ${ }^{d}$ From a single determination.

The full HSET protein folded conformation has also been predicted by AlphaFold. ${ }^{23,24}$ Significant conformational flexibility is anticipated in the HSET motor domain by analogy to the known conformational repertoires of other kinesins, for example, Eg5. ${ }^{25}$ Independent docking studies of the previously reported inhibitor AZ82 have suggested two different potential
binding poses. ${ }^{18,22}$ Attempts to generate a crystal structure of 2 or close analogues bound to HSET were unsuccessful, and in the absence of a robust structure-based approach, we built a SAR through iterative cycles of design, synthesis, and testing.

Several close analogues (3-6 and 8-13, Table 1) with altered benzamide motifs were quickly synthesized from an advanced

intermediate or purchased (3 and 8). Although positioning the methyl substituent para to the amide linkage in 4 retained activity, the ortho-substituted analogue 3 had a seventy-fold reduced potency against HSET. Replacing the 3-methylbenzamide with simple acetamide (8), benzamide (9), 3-chlorobenzamide (6), or the saturated cyclohexane carboxamide (10) ablated the activity. We also investigated the replacement of the ethyl ester substituent in 2 by an isosteric amide (7) but observed no activity. When the 3 -methyl substituent was changed to ethyl (5), methoxy (11), or phenyl (12), similar biochemical activity to the hit $\mathbf{2}$ was retained, giving confidence that further exploration along this vector was possible.
A scan of more elaborate analogues prepared from commercially available meta-substituted benzoic acids pleasingly provided the first submicromolar inhibitor 13, which displayed improvements in both LE and LLE (Table 1) and enhanced potency over the reference compound $\mathbf{1}$. Extending out further from the oxadiazole methyl group proved problematic, with even the ethyl analogue $\mathbf{1 4}$ having 33 -fold reduced HSET inhibitory activity. Focusing on other five-membered heterocyclic 3-substituents showed that the presence of a hydrogenbond donor (HBD) in the ring eliminated potency, for example, 15. The oxadiazole regioisomers 16 and 17 retained similar activity to $\mathbf{1 3}$, and an improvement in activity was noted for the 2-methyl tetrazol-5-yl substituent 18 with a HSET $\mathrm{IC}_{50}$ of 27 $\mathrm{nM}, \mathrm{LE}=0.34$, and much increased LLE $=5.4$. Subsequent screening of 18 at a higher ATP concentration in the HSET ADP-Glo assays showed a drop in inhibitory activity, suggesting an ATP-competitive mode of action like that of 2 (Table 4). Counter-screening of $\mathbf{1 3}$ and $\mathbf{1 8}$ confirmed that the gains in HSET activity had not compromised the selectivity against Eg5 (Table 4). While there were some benefits of the 2-methyl tetrazol-5-yl substituent 18, due to the high hydrogen-bond
acceptor (HBA) count, we reverted to the oxadiazole analogues to investigate SARs in other parts of the scaffold.

We investigated the contributions of the thiazole substituents and the flexible alkyl linker to the HSET activity. Removing either the methyl group (19) (Table 2) or the ethyl ester (20) on the thiazole caused a 65 -fold or 3000 -fold reduction in potency, respectively. Likewise, shortening (21) or lengthening (22) the alkyl chain between the amides abolished the HSET activity. The HBD on the amide adjacent to the thiazole 23 could be masked with a methyl group without effecting the potency, while this was not the case for the benzamide 24, where methylation gave a 700 -fold reduction in activity. Here either the HBD appeared important for binding or the $N$-substitution may have a detrimental effect on the ligand conformation. Analogues where the connectivity of this amide bond was reversed also displayed no activity against HSET (compounds not shown). In contrast, the reversal of the amide connectivity adjacent to the thiazole ring 25 was tolerated, although with a six-fold drop in potency. Attempts to replace the thiazole ring with other heteroaromatic scaffolds showed that only small changes were tolerated; for example, the removal of the azole nitrogen gave the isosteric thiophene 26 with comparable activity. It was difficult to replace the thiazole sulfur, and pyridine 27, a classical isostere for a thiazole, gave a greater than 180 -fold reduction in potency. The only non-sulfur-containing five-membered ring with acceptable activity proved to be the pyrazole analogue 28, but this did not enhance LLE, while other close analogues such as the imidazole 29 showed no HSET inhibition.

The addition of a methyl group to the alkyl chain linking the two aromatics rings introduced a chiral center and interestingly showed a fourfold preference for the $(S)$-enantiomer 30 over the $(R)$-enantiomer 31, which we would later build on. With the ester substituent seemingly essential for activity, analogues probing the ester alkyl group showed that an extension to a

propyl chain 32 gave a fivefold increase in inhibition while maintaining a favorable LLE. Although we had discovered several activity cliffs, we had identified compounds with nanomolar potencies in the biochemical HSET assay. Counter-screening of 26 and 32 confirmed that no Eg5 inhibition had been introduced. Conducting the ADP-Glo HSET assay for these compounds in the presence of an increased ATP concentration ( $500 \mu \mathrm{M}$ ) showed a drop in inhibitory activity as seen for 2 (see Table 4).
To explore the behavior of the HSET inhibitors in a cellular context, we developed an assay to compare their effects on the degree of mitotic spindle multipolarity observed in tetraploid (4N) DLD1 human colon cancer cell lines and diploid (2N) DLD1 cells induced to exhibit high centrosome amplification through treatment with dihydro-cytochalasin B (DCB) to transiently block cytokinesis and induce tetraploidisation and centrosome amplification (4NCA). ${ }^{26,27}$ An increase of typically $10 \%$ mitotic spindle multipolarity was observed in the centrosome-amplified (4NCA) DLD1 cell line when treated with HSET inhibitors 13, 18, and 26 at $15 \mu \mathrm{M}$. Importantly, no increases in multipolar mitoses were observed in the noncentrosome amplified DLD1 ( 4 N ) cell line at the same concentration (Table 4). Compound 32, which was more potent in our biochemical assay, showed an increased multipolarity ( $21 \%$ ) in the 4NCA cells, again with a minimal effect on the 4 N cell line (Table 4, Figure S4). This compound gave an estimated half-life of 215 min in a BALB/c mouse plasma stability assay, which gave us an indication of the enzymatic and hydrolytic stability of the ester moiety. Encouraged that our inhibitors were showing the expected phenotypic effect in cancer cells, we wished to further understand their mechanism by demonstrating their direct interaction with the HSET protein in vitro and to confirm their colocalization and specific binding to HSET in the relevant cellular compartment.

Demonstrating compound colocalization with the intended target in the relevant cellular compartment in cells that are proficient for that target, and not in cells that lack the expression of the intended target, is a desirable step in confirming the mechanism of new inhibitors. ${ }^{20}$ In conjunction with biophysical binding assays, this can demonstrate specific target binding. ${ }^{28} \mathrm{~A}$ fluorescent tag may be added to a cell-active compound in order to visualize its localization. ${ }^{29-31}$ However, this approach often generates high-molecular-weight probes with poor cell perme-
ability. ${ }^{31}$ To overcome this, one elegant solution is to assemble the fluorescent probe inside the cell using bioorthogonal clickchemistry. ${ }^{32-34}$ Bioorthogonal chemistry has been widely used in chemical biology strategies, including for imaging small molecules in cells, and more than 20 different biorthogonal reactions are well-established in the literature. ${ }^{32,33,35}$ In particular, inverse electron demand Diels-Alders (IEDDA) cycloaddition has gained popularity due to its extremely fast rate (rate constant $k_{2} \sim 10^{2}-10^{6} \mathrm{M}^{-1} \mathrm{~s}^{-1}$ ), high signal-to-noise ratio, and simple reaction conditions. ${ }^{36,37}$ A common variant of IEDDA involves using a tetrazine-tagged fluorescent dye as the electron-poor diene and a strained alkene or alkyne (such as cyclopropene, bicyclononyne, or trans-cyclooctene) added to a ligand as the electron rich dienophile. ${ }^{38}$ The trans-cyclooctene (TCO) ring has become the strained alkene of choice for this reaction due to its commercial availability and fast reactivity. ${ }^{39}$

We envisaged a TCO probe based on 32 substituted with an alkylamine handle to enable the addition of a linker and the TCO headgroup. Several attachment points on our scaffold for an alkyl linker were considered, though most resulted in an unacceptable loss of HSET inhibitory activity (compounds not shown). However, using the information from 30, 31, and 32, we identified that an alkyl side chain was tolerated on the linker adjacent to the benzamide (Table 3). Starting from the more active ( $S$ )-methyl-substituted analogue 30, the length of the substituent was probed, and the aminopropyl analogue 33 provided the best balance of retained potency without the addition of excessive lipophilicity. The enhanced potency of the $(S)$-enantiomer over the $(R)$-enantiomer was confirmed with the secondary amine analogues 34 and 35 (CCT368772). The tertiary amine 36 retained good in vitro potency against HSET, possessed one less HBD, which was beneficial for permeability, and exhibited high kinetic aqueous solubility. Compounds 35 and 36 exhibited similar selectivity over Eg5 and sensitivity to the ATP concentration in the ADP-Glo assay as the progenitor compounds and enhanced multipolar mitotic spindle formation selectively in DLD1 centrosome-amplified cells (Table 4, Figure S4).

Before investigating the cellular probes, we first prepared a fluorescence-tagged analogue of 33 to demonstrate direct binding to HSET in a MT-free environment. Since the ADPGlo assay measures the MT-stimulated turnover of ATP by HSET, it does not distinguish between compounds that directly

bind to HSET to inhibit the dynamic cycle and compounds that interfere with the binding of HSET and MT through interactions with MT binding sites. The sulfoCy5-tagged analogue 37 was shown to inhibit HSET-dependent ATP hydrolysis with moderate activity (Table 3). The affinity of the sulfoCy5-tagged probe for the isolated full-length HSET protein was determined using a fluorescence polarization (FP) assay, which showed saturable binding consistent with a $1: 1$ stoichiometry ( $K_{\mathrm{d}}=371 \mathrm{nM}$ ) (Figure 1a). To determine the effect of MTs on compound binding, a titration of HSET protein was carried out in the presence of MTs at 7 and $70 \mu \mathrm{~g} \mathrm{~mL}{ }^{-1}$ concentrations (Figure 1b). MT reconstitution buffer alone showed a twofold reduction in the probe affinity for HSET; however, this is within assay variation. In the presence of MTs in reconstitution buffer, minimal effects were seen on the binding affinity of the probe, indicating the compound does not interfere with MT binding. We tested the ability of ATP, ADP, and the unsubstituted compound $\mathbf{1 3}$ to displace the binding of FP probe 37 from the isolated HSET protein using a competitive binding FP assay (Figure 1c). Both nucleotide analogues showed the displacement of the probe, as did the parent thiazole 13. These data confirm that this compound series binds to a site on the HSET protein independent of the presence of MTs and is biochemically competitive with nucleotide binding.
With proof of direct binding to HSET shown in biochemical assays using the fluorescent probe 37 , we sought to adapt the molecule to provide a click-chemistry probe for intracellular target engagement. Three compounds $38-40$ were synthesized, two of which contained a further extension of the side chain to 35 before the addition of the TCO group in all cases. The impact of the linkers and the TCO ring on the potency and solubility were assessed (Table 4). The directly linked carbamate 38 showed the largest decrease ( 11 -fold) in activity compared to its parent compound. A large decrease in solubility was also observed, which we assumed to be due to the removal of the basic amine in the linker upon the conversion to the carbamate. Distancing the TCO moiety from the core with an extended polyethylene glycol linker in 39 or a more rigid butynecontaining linker in 40 (ССТ369834) was found to be beneficial for retaining HSET inhibition. Despite the presence of the amine in 40, the aqueous solubility was still significantly reduced compared to that of the parent 35, possibly due to a reduction in the basicity of the propargylamine. In contrast, the addition of
the flexible 2-(aminoethoxy)ethoxy chain to the linker in 39 maintained solubility.
Next, the efficiency of the IEDDA reaction between the three TCO probes and [4-(1,2,4,5-tetrazin-3-yl)phenyl]methanamine hydrochloride was investigated (see Figures S1-S3). The TCO probes and the tetrazine were mixed in a 1:2 ratio at room temperature, and the mixtures were analyzed by tandem LC-MS after 5 min . The TCO probes 38 and $\mathbf{4 0}$ reacted quickly, with $91 \%$ and $84 \%$ conversion, respectively. Surprisingly, the reaction with TCO probe 39 gave only $35 \%$ conversion after 5 min . We speculate that the potential for the formation of intramolecular H-bonds between the flexible 2-(aminoethoxy) ethoxy chain and the HSET binding core of 39 could render the TCO reactive group less accessible and lead to a lower reaction rate compared to the other two probes. Due to their high affinity for the target and fast reactivity with the model tetrazine, TCO probes 38 and 40 were selected to react with a Cy-5 tetrazine dye (Scheme 1) to explore the target binding in cells.

The Cy-5 tetrazine dye selected for this experiment is not cellpermeable, thus fixation and permeabilization of cells were necessary prior to its addition. Experiments were conducted in DLD1 4N cells and, as a negative control, isogenic 2N DLD1 HSET KO cells in which HSET expression was prevented by the disruption of the HSET gene using CRISPR. Cells were treated first with proTAME for 2 h to accumulate mitotic events, followed by treatment with the TCO probe 40 for 45 min . The live cells were then fixed and permeabilized before treatment with the tetrazine-Cy5 dye and incubation to allow the IEDDA reaction to occur. Additionally, the cells were stained for the endogenous HSET protein using indirect immunofluorescence and imaged to observe the fluorescence from both the TCO probe and antibody-labeled HSET. Tetrazine-linked dye concentrations ( $200-400 \mathrm{nM}$ ) and the incubation time ( 10 min ) were identified that did not produce a signal in the absence of a TCO probe. A $3 \mu \mathrm{M}$ concentration of the probe 40 gave an acceptable signal-to-noise ratio of around 2:1. Even under these optimal conditions, some residual uniform cytoplasmic Cy5 signal was observed within the cells. However, a clear Cy5 decoration of the mitotic spindle was seen, which overlapped with the signal from the antibody-probed endogenous HSET protein (Figures 2A and S6). Importantly, despite the same diffuse background cytoplasmic signal, minimal localization of the dye on the spindle was observed in the negative control DLD1 HSET KO cells. We observed a $14-17$-fold increase in

## Scheme 1. Anticipated IEDDA Reaction between TCO Probe 40 and Tetrazine-Cy5 41

signal in DLD1 4 N cells treated with 40 relative to tetrazine-Cy5 alone. In comparison, a $7-8$-fold increase was observed in HSET nonexpressing cells, indicating this as the level of nonspecific background generated by the labeled probe. Comparing the intensity of click probe labeling coincident with the mitotic spindle in DLD1 4 N cells to that in DLD1 HSET KO cells after both were treated with 40, we observed a twofold higher signal in the former. In an additional optimization of the assay conditions using 38 as the probe, we found that longer washing steps improved the signal/background ratio through better wash-off of the unbound click probe from the cells (Figure S5).

With this refinement in place, we performed competition experiments to displace the TCO probe 40 with increasing concentrations of unlabeled compound 36. Inhibitor 36 reduced the localization of the TCO probe 40 on the HSET in a dosedependent manner (Figures 2B and 2C and S6), a direct replication of the probe displacement seen in our biochemical FP assay but in a cellular context. However, even at the highest concentration used for $36(10 \mu \mathrm{M})$, some residual localization of the probe 40 was still observed on HSET. This may be due to the limited solubility of 36 at higher concentrations or the increased localization of HSET on the mitotic spindle in response to binding these HSET inhibitors. Indeed, we observed that as the concentration of the inhibitor increased, the HSET antibody signal was observed to increase on the mitotic spindle toward the mitotic pole in a concentration-responsive manner (Figure 2D). This suggests that the inhibition of HSET by the more potent 36 causes the kinesin to bind more tightly on the microtubule ends, closer to the mitotic pole centrosomes. Therefore, to correctly depict the competitive effect of increasing concentrations of 36, we plotted the ratio of the corrected click probe Cy5 signal intensity (subtracting KO cell signal) over the total HSET protein 488 signal, which was normalized to \% control (Figure 2E)
The tetrazine-Cy5 dye alone did not produce any signal in either HSET-expressing or HSET-nonexpressing cells, while minimal localization of 40 to the mitotic spindle was observed in HSET-nonexpressing cells (Figure 2A). The difference in the amount of inhibitor required to displace 40 from HSET in this target engagement assay to that needed to observe the downstream phenotypic effects suggests that a high threshold of HSET binding on the mitotic pole end of microtubules may be required to induce multipolarity with these inhibitors. More investigation into the underlying mechanism of action is required with inhibitors that are more selective and potent in cells. However, these results showed the colocalization of the
labeled probe compound with HSET on the mitotic spindle, which can be displaced by an unlabeled compound, and provided evidence of direct cellular target engagement in cells for this series of HSET inhibitors.

## ■ CONCLUSION

This work reports the successful progression of a functional biochemical HTS hit (2) with micromolar in vitro inhibition of HSET to compounds with nanomolar biochemical potencies and high selectivity against the opposing mitotic kinesin Eg5. A suitable point for the attachment of reporter groups without perturbing HSET inhibition was identified through the development of structure-activity relationships using the functional biochemical assay for MT-stimulated HSET-dependent ATP hydrolysis. The linkers provided the opportunity to introduce basic amines to enhance solubility and mitigate the increased size of the reporter molecules. A fluorescently labeled probe, 37, directly bound to HSET in the absence and presence of microtubules and confirmed the binding site of the new HSET inhibitors to be located on the HSET protein. Moreover, fluorescent probe binding was competed by the nucleotides ATP and ADP, consistent with the observation that increasing the ATP concentration reduced the inhibitor potency in the HSET-dependent ATP hydrolysis assay. The compounds caused an increase in the formation of multipolar mitotic spindles in dividing aneuploid centrosome-amplified human colon cancer cells, while minimal effects on the frequency of multipolar mitoses were seen in an isogenic non-centrosomeamplified cell line. To confirm target engagement in cells and explore the intracellular localization of the new inhibitors, the substituted analogue 35 was used as a scaffold to design trans-cyclooctene-tagged probes. We demonstrated the specific colocalization of HSET and the TCO-tagged probe 40 at the mitotic spindle through an IEDDA click-reaction with a tetrazine-Cy5 dye following the permeabilization of the cells. Furthermore, concentration-dependent competitive displacement of the probe with a non-labeled ligand was achieved, providing an assay for assessing target engagement in cells. These data confirm the potential of the thiazole-derived compounds as novel HSET inhibitors, and future reports will focus on the optimization of cellular activity.

## CHEMISTRY

A straightforward synthetic route to access compounds 2, 4-7, and 9-18 was developed (Scheme 2). First, the commercially available ethyl 2-amino-4-methylthiazole-5-carboxylate 43 was coupled with 3-((tert-butoxycarbonyl)amino)propanoic acid in

Figure 2. (A) Images showing the distribution of Cy5-induced fluorescence from tetrazine-Cy5 (Txz-Cy5) with and without the addition of TCO probe 40 compared to the HSET intensities identified by indirect immunofluorescence using an Alexa-488 fluorophore in DLD1 4N and DLD1 HSET KO cell lines. The overlay shows the mitotic pole areas identified by staining for pericentrin (red), the HSET intensity as measured by indirect immunofluorescence using an Alexa-488 fluorophore (green) and the nucleus stained with DAPI (blue). (B) Images showing the effects on the fluorescence of increasing the concentration of 36 , which outcompeted the TCO probe 40. (C) Plot showing the decreasing Cy5 signal intensity measured at the mitotic pole areas (defined by pericentrin staining), normalized to $\%$ control, with the increasing concentration of 36. (D) Plot showing the increasing HSET 488 signal measured at the mitotic pole areas (defined by pericentrin staining), normalized to $\%$ control, with the increasing concentration of 36. (E) Plot showing the ratio of the corrected click probe Cy5 signal intensity (subtracting KO cell signal) the over total HSET protein 488 signal, normalized to $\%$ control, with the increasing concentration of 36.
the presence of $\mathrm{HOBt} / \mathrm{EDC}$ in DMF at $50^{\circ} \mathrm{C}$ to give ethyl 2-(3-((tert-butoxycarbonyl)amino)propanamido)-4-methylthiazole-5-carboxylate 45. N-Deprotection of 45 was performed using 4 N HCl in 1,4-dioxane at room temperature, and subsequent

HATU-mediated amide coupling of a range of benzoic acid derivatives afforded compounds 2, 4-6, and 9-18 (Table 1). The homologated example 22 and $N$-methylated derivative 23 were prepared in an analogous manner using 4-(tert-

Scheme 6. Synthesis of FP Probe $37^{a}$

${ }^{a}$ Reaction conditions are as follows: (a) TEA, DMF, rt, $16 \mathrm{~h}, 62 \%$.
butoxycarbonylamino)butanoic acid or ethyl 4-methyl-2-(methylamino)thiazole-5-carboxylate 44, respectively (Table 2). Example 7 was obtained by reacting 2 with NaOH in $\mathrm{MeOH} /$ water at $55^{\circ} \mathrm{C}$ for 1 h to give compound 51 . Finally, the amide bond was formed by the sequential addition of $\mathrm{HOBt} /$ EDC and ethanaminium chloride in the presence of DIPEA in DMF to give compound 7.
An adapted three-step synthetic route permitted the variation and replacement of the thiazole moiety (Scheme 3). To make the amide bond, 3-(5-methyl-1,2,4-oxadiazol-3-yl)benzoic acid 55 was reacted with the corresponding amino acid methyl esters $\mathbf{5 2 - 5 4}$. Next, saponification of the methyl esters 56-58 to the equivalent acids $59-\mathbf{6 1}$ was performed using aqueous lithium hydroxide. Finally, 19-21, 24, 26-29, and 32 (Table 2) were
prepared by reacting the appropriate amino heterocycles using $\mathrm{HOBt} / \mathrm{EDC}$ as the coupling agent accompanied by heating at 60 ${ }^{\circ} \mathrm{C}$ for 18 h . A similar synthesis coupled the $(R)$ - and ( $S$ )enantiomers of tert-butyl-3-aminobutanoate to 55 before the removal of the tert-butyl group with TFA and gave the acids $\mathbf{6 6}$ and $\mathbf{6 7}$ for the final amide formation, affording the epimers 30 and 31, respectively.

The synthesis was adapted to obtain the reverse amide 25 (Scheme 4). The Grignard reagent of commercially available ethyl 2-bromo-4-methylthiazole-5-carboxylate $\mathbf{6 8}$ was prepared by a magnesium-bromide exchange reaction using Knochel's turbo-Grignard reagent $(i \mathrm{PrMgCl} \cdot \mathrm{LiCl})$ followed by quenching with $N$-formylmorpholine to afford ethyl 2-formyl-4-methyl-thiazole-5-carboxylate 69. This was transformed to the

Scheme 7. Synthesis of TCO Probes 38-40 ${ }^{a}$

${ }^{a}$ Reaction conditions are as follows: (a) 87, DMF, rt, $7 \mathrm{~d}, 64 \%$; (b) HCl in dioxane, $\mathrm{rt}, 4-6 \mathrm{~h}, 44-65 \%$; (c) 89, DIPEA, DMF, rt, $16 \mathrm{~h}, 67-96 \%$; and (d) 90, DMF, rt, $24 \mathrm{~h}, 46 \%$.
corresponding acid 70 by Pinnick oxidation, and the $N$-Bocethylenediamine linker was attached using standard HOBt/ $\mathrm{EDC} \cdot \mathrm{HCl}$ coupling conditions to produce intermediate 71 in moderate yield. $N$-Deprotection of $\mathbf{7 1}$ and subsequent HOBt/ EDC-mediated coupling with $\mathbf{5 5}$ afforded $\mathbf{2 5}$ in a $51 \%$ yield.
The synthesis of 33 (Table 3) was achieved in three steps using commercially available chiral amine 73, which was subjected to two successive amide coupling steps and the removal of the Boc protecting group (Scheme 5). A double reductive amination with formaldehyde and sodium triacetoxyborohydride gave 36 in a modest yield. To access 34 and 35, the appropriate chiral linker containing a Boc-protected secondary amine was made in four steps from 75 using a chiral aza-Michael addition as the key step. ${ }^{40}$ Linker component $\mathbf{8 3}$ was obtained with a 97:3 e.r. as determined by ${ }^{1} \mathrm{H}$ NMR after derivatization using Mosher's acid (see the Supporting Information). Coupling the appropriate benzoic acid 55 to the chiral amino linker using propanephosphonic acid anhydride (T3P) gave 85. Hydrolysis of the ester and amide coupling with EDC and HOBt followed by the removal of the Boc group with TFA gave 35. A similar sequence was employed to obtain the epimer 34 from 82.

The FP probe was synthesized by reacting the primary amine on 33 with commercially available sulfoCy5-NHS ester 86 (Scheme 6).
From compound 35, the synthesis of the TCO probes began with the direct addition of the trans-cyclooctene ring with a carbamate linkage using commercially available TCO-NHS carbonate (Scheme 7) to yield 38. Other TCO probes 39 and 40 were synthesized by incorporating either an additional flexible 2(aminoethoxy)ethoxy chain or a more rigid 1-amino-but-2-yne into the linker. The Boc-protected amino linkers with a suitable leaving group were reacted with the secondary amine of 35 . Removal of the Boc protecting group with HCl gave free amines 88 and 91, which were progressed to the final carbamate formation with TCO-NHS 89 to give compounds 39 and 40, respectively.

## EXPERIMENTAL SECTION

ADP-Glo HSET ( $3 \mu \mathrm{M}$ ATP), ADP-Glo HSET ( $500 \mu \mathrm{M}$ ATP), and ADP-Glo Eg5 Assays. The HSET or Eg5 ATPase activity was measured using the ADP-Glo Kinase Assay kit (Promega, V9102). The assays were run using final concentrations of 5 nM full-length human N terminal His-tag HSET or 4 nM GST-tagged Eg5 motor domain protein (Cytoskeleton, EG01) and an assay buffer containing 20 mM HEPES pH 6.8, $10 \mathrm{mM} \mathrm{MgCl} 2,0.25 \mathrm{mM}$ EGTA, 0.4 mM Triton X-100, and 1 mM DTT. Preformed microtubules (Universal Biologicals Cambridge, bovine MT001-XL, or porcine MT002-XL), which were reconstituted in 15 mM PIPES $\mathrm{pH} 7,1 \mathrm{mM} \mathrm{MgCl} 2$, and $20 \mu \mathrm{M}$ paclitaxel, were present at a final assay concentration of $70 \mu \mathrm{~g} / \mathrm{mL}$. A reaction volume of $5 \mu \mathrm{~L}$ was used in Proxiplate 384 plus white assay plates (PerkinElmer, 6008280). To measure compound inhibition, 100 nL of compound dissolved in DMSO or DMSO alone was preincubated with the HSET and microtubules for 10 min before $3 \mu \mathrm{M}$ Ultra-Pure ATP was added to start the ATPase reaction for the $3 \mu \mathrm{M}$ ATP HSET assay. For the $500 \mu \mathrm{M}$ ATP HSET assay, the addition of $500 \mu \mathrm{M}$ UltraPure ATP was used. For the Eg5 ATPase assay, $4.8 \mu \mathrm{M}$ Ultra-Pure ATP was used. All reactions were incubated at $25^{\circ} \mathrm{C}$ for 80 min and then stopped by the addition of $5 \mu \mathrm{~L}$ of the ADP-Glo reagent. $10 \mu \mathrm{~L}$ of Kinase Detection Reagent was then added after a further 45 min of incubation. The luminescence was read after 45 min on a PheraStar FSX plate reader (BMG Labtech). The data processing was performed using Dotmatics Studies software package. Percentage inhibition was determined based on normalization to high controls ( $0 \%$ inhibition, all reagents with 100 nL of DMSO alone) and low controls ( $100 \%$ inhibition as a high control, without HSET). The $\mathrm{IC}_{50}$ values for each compound were determined using a four-parameter logistic curve fit of \% inhibition versus concentration.

Fluorescence Polarization Assays. Steady-state fluorescence polarization binding assays were performed using the fluorescencetagged probe 37. All assays were performed in a black ProxiPlate-384 Plus plate (PerkinElmer, 6008260) in a $10 \mu \mathrm{~L}$ volume in buffer containing 20 mM HEPES $\mathrm{pH} 7.5,200 \mathrm{mM} \mathrm{NaCl}, 1 \mathrm{mM}$ TCEP, 10 $\mathrm{mM} \mathrm{MgCl} 2,0.1 \mathrm{mM}$ Triton X-100, and 5\% glycerol (v/v). Full-length human N-terminal His-tag HSET was used, with a final concentration of 2.5 nM 37 probe. The assays were sealed and incubated in the dark at $25^{\circ} \mathrm{C}$ and then the FP signal was read on an EnVision multimode plate reader (PerkinElmer Life Sciences) using excitation at 620 nm and parallel and perpendicular emissions at 688 nm . All data processing was done using Prism (GraphPad Software).

For the probe $K_{\mathrm{d}}$ determinations, FL HSET final concentrations were used between 2000 and 0.5 nM . When present, preformed microtubules (Universal Biologicals Cambridge, bovine MT001-XL or porcine MT002-XL), which were reconstituted in 15 mM PIPES pH 7 , $20 \mu \mathrm{M}$ paclitaxel, or reconstitution buffer alone, were preincubated with HSET for 10 min and then added to the probe. The plate was read after 3 h of incubation in the dark at $25^{\circ} \mathrm{C}$. $K_{\mathrm{d}}$ values were determined using a 1:1 site binding model of the fluorescence polarization versus protein concentration.
For the competition assays, 100 nL of compound dissolved in DMSO or DMSO alone was added to create 11 pt concentration response curves between 100 and $0.001 \mu \mathrm{M}$ final concentrations. This assay used 400 nM FL HSET, and the plate was read after 2 h of incubation in the dark at $25^{\circ} \mathrm{C} . \mathrm{IC}_{50}$ values were determined as for the ATPase assay using a four-parameter statistical logistic curve fit.
DLD1 Cellular Models. The cellular models consisted of chromosomally stable human colon cancer DLD1 diploid (2N) and tetraploid ( 4 N ) cells, along with tetraploid centrosome -amplified (4NCA) DLD1 cells and DLD1 HSET knockout (KO) cells. DLD1 2N and 4 N cells were generated and characterized as previously described. ${ }^{27,41,42}$ In order to generate 4 NCA cells, we used dihydrocytochalasin B (DCB) to transiently block cytokinesis and induce tetraploidisation and centrosome amplification in DLD1 cells. Centrosome amplification in 4NCA cells is transient and therefore they were generated from 2 N cells for each run of the assay. ${ }^{27}$ The DLD1 HSET KO cells were knockout clones generated by CRISPR and validated by sequencing to have a homozygous deletion in the KIFC1 gene
Multipolarity Assay. Inhibition of HSET-mediated clustering was measured using a phenotypic assay measuring the formation of multipolar metaphase spindles in DLD1 cells with (4NCA) or without ( 4 N ) centrosome amplification. 4 NCA cells were generated by treating 2N DLD1 cells with $2 \mu \mathrm{M}$ DCB for 24 h , washed, and released in growth media for 24 h .4 N and 4NCA DLD1 cells were plated in 96well ibidi $\mu$-Clear plates (IB-89626, ibidi) with a no. 1.5 polymer coverslip bottom with optimal imaging properties. To enrich the mitotic population, cells were first treated for 3.5 h with $8 \mu \mathrm{M}$ proTAME (I-440-01M, R\&D system), an inhibitor of APC/C that transiently arrests cells in metaphase without affecting the structure of the spindle. Following the initial arrest, cells were treated with HSET compounds in the presence of $8 \mu \mathrm{M} \mathrm{MG}$-132 (S2619, SelleckChem), a proteasome inhibitor that helps to maintain the metaphase arrest, where the number of spindle poles/cell can be optimally quantified by an automated segmentation analysis.

Cells were then fixed in methanol and stained for 3 h for mitotic pole marker aurora A (1:1000 610939 mouse anti-IAK1, BD Biosciences) and phosphorylated histone H3 (1:1500 ab47297 anti-histone H3 pS 10 , Abcam) as a marker of mitotic cells in 1.5\% FBS in PBS. Following primary antibody treatment, cells were incubated with secondary antibodies Alexa Fluor 488 goat antimouse and Alexa Fluor 555 goat antirabbit (1:1500, A11029 and A21429, respectively, Life Technologies) together with $1 \mu \mathrm{~g} / \mathrm{mL}$ DAPI (D9542, Sigma) in $1.5 \%$ FBS in PBS. Image acquisition was performed at $10 \times$ using the GE INCELL 2200 High Content Imaging System (Cytiva) and analyzed using the InCell Investigator software. Mitotic cells were identified by high pHH 3 staining and were scored as multipolar if they had more than two mitotic spindle poles. The percentage of multipolar mitoses was calculated by dividing the number of multipolar mitoses by the total of all visible mitoses in one well of a 96 -well plate ( $n>100$ for each replicate, two replicates per concentration point).

Click Probe Localization Target Engagement Assay. Direct target engagement of active inhibitor 36 was measured by calculating its capacity to displace the TCO-containing probe $\mathbf{4 0}$. 4 N DLD1 cells and DLD1 HSET KO cells (negative control) were plated in 96 -well ibidi $\mu$ Clear plates (IB-89626, ibidi). Cells were first treated for 2 h with $8 \mu \mathrm{M}$ pro-TAME (I-440-01M, R\&D system) to accumulate mitotic cells and were then treated with $8 \mu \mathrm{M}$ MG-132 (S2619, SelleckChem) and $3 \mu \mathrm{M}$ 40, alone or together with active inhibitor 36 in DMEM media with 1\% FBS for 45 min . Cells were then washed three times in DMEM, with the second wash being incubated for 10 min to ensure the optimal
reduction of unspecific compound binding. After an additional PBS wash, cells were then fixed in 4\% PFA/PBS (15670799, Thermo Scientific) prior to incubation with 400 nM tetraszine-Cy5 (CLK-01505 , Jena Biosciences) in $1.5 \%$ FBS/PBS for 10 min at room temperature. Cells were permeabilized by the addition of $0.5 \%$ TritonX-100/PBS for 5 min before being stained overnight for Pericentrin ( $1: 1500 \mathrm{ab} 28144$ mouse anti-PCNT, Abcam) and KIFC1 (1:1500 12313S rabbit anti-KIFC1, Cell Signaling Technologies). Secondary antibodies Alexa Fluor 488 donkey antirabbit and Alexa Fluor 555 donkey antimouse (1:1500, A21206 and A31570, respectively, Life Technologies) were added together with $1 \mu \mathrm{~g} / \mathrm{mL}$ DAPI (D9542, Sigma) in 1.5\% FBS in PBS.

Plates were imaged at $40 \times$ using a Zeiss LSM980 confocal microscope with Airyscan 2. The subsequent analysis and quantification were performed using 3D image segmentation with the Arivis 4 D software. Mitotic cells were segmented by selecting for the highest density (integrated DAPI intensity/total volume), and the mitotic pole areas were segmented using the Pericentrin signal. The signal of the click probe (Cy5) and total KIFC1 (FITC) was measured on the mitotic pole area, and both were normalized to the control condition containing 40 probe alone. The ratio of probe per target (click probe pole integrated intensity signal/KIFC1 pole integrated intensity signal) was used to calculate the occupancy of the probe in the target protein and normalized to the control condition containing 40 probe alone ( $n>$ 100 for each replicate, two replicates per concentration point).
In Silico Chemistry. cLogP calculations were performed using MoKa from Molecular Discovery.

General Synthetic Chemistry. Reactions were carried out under $\mathrm{N}_{2}$. Organic solutions were dried over $\mathrm{MgSO}_{4}$ or $\mathrm{Na}_{2} \mathrm{SO}_{4}$. Starting materials and solvents were purchased from commercial suppliers and were used without further purification. Reactions heated by microwave irradiation were carried out using a Biotage Initiator microwave reactor. Ion-exchange chromatography was performed using ISOLUTE Flash SCX-II (acidic) or Flash NH2 (basic) resin cartridges. Silica column chromatography was performed using Biotage SP1 or Isolera medium-pressure chromatography systems using prepacked silica gel cartridges (normal phase (NP), Biotage SNAP KP-Si; reverse phase (RP), Biotage SNAP Ultra C18). Preparative highperformance liquid chromatography (HPLC) was carried out at rt using a 1200 series preparative HPLC (Agilent, Santa Clara) over a 15 min gradient elution from 60:40 to $0: 100$ water $/ \mathrm{MeOH}$ (both modified with $0.1 \%$ formic acid) at a flow rate of 5,20 , or $40 \mathrm{~mL} / \mathrm{min}$ depending on the column size used. Standard injections of $500 \mu \mathrm{~L}$ to 2 mL (with needle wash) of the sample were made onto ACE 5 C18-PFP columns $\left(5 \mu \mathrm{~m}, 250 \times 10 / 250 \times 21.2 / 250 \times 30 \mathrm{~mm}^{2}\right.$, Advanced Chromatography Technologies, Aberdeen, U.K.). UV-vis spectra were acquired at 254 nm on a 1200 Series Prep Scale diode array detector (Agilent, Santa Clara).

NMR spectra were recorded on Bruker AMX500 or AV600 instruments using internal deuterium locks. Chemical shifts ( $\delta$ ) are reported relative to tetramethylsilane ( $\delta 0$ ) and/or referenced to the solvent in which they were measured. Compounds were assessed for purity by tandem HPLC-MS. Combined HPLC-MS analyses were performed using an Agilent 6210 time-of-flight (ToF) HPLC-MS with a Merck Chromolith Flash column (RP-18e, $25 \times 2 \mathrm{~mm}$ ), a Waters Xevo G2QToF HPLC-MS, or an Agilent 1260 Infinity II UPLC-MS with either a Phenomenex Kinetex C18 column ( $30 \times 2.1 \mathrm{~mm}, 2.6 \mu \mathrm{~m}$, $100 \AA$ ) or a Agilent Poroshell C18 column ( $30 \times 2.1 \mathrm{~mm}, 2.6 \mu \mathrm{~m}, 100$ $\AA$ ). Analytical separation was carried out at $30^{\circ} \mathrm{C}\left(40^{\circ} \mathrm{C}\right.$ for Agilent 62102 min run) with UV detection at 254 nm , and ionization was performed using positive-ion electrospray. The mobile phase was a mixture of MeOH (solvent A ) and water (solvent B), both of which contained formic acid at $0.1 \%$. Standard 2 min runs: Agilent 6120, gradient elution 5:95 (A/B) to 100:0 (A/B) over $1.25 \mathrm{~min}, 100: 0(\mathrm{~A} /$ B) for 0.5 min , reversion back to $5: 95(\mathrm{~A} / \mathrm{B})$ over 0.05 min , finally 5:95 (A/B) for 0.2 min ; Agilent 1260 and Xevo, gradient elution 10:90 (A/ B) to 90:10 (A/B) over $1.25 \mathrm{~min}, 90: 10(\mathrm{~A} / \mathrm{B})$ for 0.5 min , reversion back to $10: 90(\mathrm{~A} / \mathrm{B})$ over 0.15 min , finally $10: 90(\mathrm{~A} / \mathrm{B})$ for 0.1 min . HRMS 4 min runs: Agilent 6120:5:95 (A/B) to 100:0 (A/B) over 2.5 min, 100:0 $(\mathrm{A} / \mathrm{B})$ for 1 min , reversion back to 5:95 (A/B) over 0.1 min ,
finally 5:95 (A/B) for 0.4 min ; Xevo, 10:90 (A/B) to $90: 10(\mathrm{~A} / \mathrm{B})$ over $3 \mathrm{~min}, 90: 10(\mathrm{~A} / \mathrm{B})$ for 0.5 min , reversion back to $10: 90(\mathrm{~A} / \mathrm{B})$ over 0.3 min , finally $10: 90(\mathrm{~A} / \mathrm{B})$ for 0.2 min ; Agilent $1260,10: 90(\mathrm{~A} / \mathrm{B})$ to 90:10 (A/B) over $2.5 \mathrm{~min}, 90: 10(\mathrm{~A} / \mathrm{B})$ for 1 min , reversion back to 10:90 (A/B) over 0.3 min , finally $10: 90(\mathrm{~A} / \mathrm{B})$ for 0.2 min . Flow rates for over 2 min runs: Agilent 6120, $1.5 \mathrm{~mL} / \mathrm{min}$; Xevo, $0.5 \mathrm{~mL} / \mathrm{min}$; Agilent 1260, $0.6 \mathrm{~mL} / \mathrm{min}$. Flow rates for 4 min : Agilent 6120, 0.75 $\mathrm{mL} / \mathrm{min}$; Xevo, $0.3 \mathrm{~mL} / \mathrm{min}$; Agilent $12600.4 \mathrm{~mL} / \mathrm{min}$.

Biologically evaluated compounds gave $>95 \%$ purity as determined by these methods (see Supporting Information).

5-Methyl-6N-((R)-1-oxo-1-((R)-pyrrolidin-3-ylamino)-3-(6-(3-(trifluoromethoxy)phenyl)pyridin-3-yl)propan-2-yl)-4-propylthio-phene-2-carboxamide [AZ82] (1) was purchased from Sigma-Aldrich (U.K.). Ethyl 4-methyl-2-(3-(2-methylbenzamido)propanamido)-thiazole-5-carboxylate (3) and ethyl 2-(3-acetamidopropanamido)-4-methylthiazole-5-carboxylate (8) were purchased from Enamine (Kyiv, Ukraine).

Ethyl 2-[3-(tert-Butoxycarbonylamino)propanoylamino]-4-methyl-thiazole-5-carboxylate (45). To a stirred solution of 3-((tert-butoxycarbonyl)amino) propanoic acid ( $2 \mathrm{~g}, 10.57 \mathrm{mmol}$ ), and HOBt ( $3.24 \mathrm{~g}, 21.14 \mathrm{mmol}$ ) in dry DMF, under a nitrogen atmosphere at room temperature, were added EDC ( $4.05 \mathrm{~g}, 21.14 \mathrm{mmol}$ ) and ethyl 2-amino-4-methylthiazole-5-carboxylate ( $2.165 \mathrm{~g}, 11.63 \mathrm{mmol}$ ) sequentially. The mixture was stirred overnight at $50^{\circ} \mathrm{C}$. The mixture was concentrated in vacuo. The crude product was dissolved in EtOAc and washed with water $(\times 1), 1 \mathrm{~N} \mathrm{HCl}(\times 1)$, aq. sat. bicarb. $(\times 1)$, and brine $(\times 1)$. The organic layer was dried over sodium sulfate and concentrated in vacuo to give $45(3.428 \mathrm{~g}, 9.59 \mathrm{mmol}, 91 \%$ yield) as a yellow solid. ${ }^{1} \mathrm{H}$ NMR $\left(500 \mathrm{MHz}, \mathrm{DMSO}-d_{6}\right) \delta 12.45(\mathrm{~s}, 1 \mathrm{H}), 6.90(\mathrm{t}, J$ $=5.7 \mathrm{~Hz}, 1 \mathrm{H}), 4.23(\mathrm{q}, J=7.1 \mathrm{~Hz}, 2 \mathrm{H}), 3.23(\mathrm{q}, J=6.6 \mathrm{~Hz}, 2 \mathrm{H}), 2.59(\mathrm{t}$, $J=6.9 \mathrm{~Hz}, 2 \mathrm{H}), 2.53(\mathrm{~s}, 3 \mathrm{H}), 1.36(\mathrm{~s}, 9 \mathrm{H}), 1.27(\mathrm{t}, J=7.1 \mathrm{~Hz}, 3 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $126 \mathrm{MHz}, \mathrm{DMSO}) \delta 170.94,162.61,159.99,156.55,155.94$, 114.23, 78.15, 60.92, 36.41, 36.06, 28.67, 17.49, 14.66. HPLC/MS (ESI): $m / z 358.1431[\mathrm{M}+\mathrm{H}]^{+} . R_{\mathrm{t}}(2 \mathrm{~min}): 1.32 \mathrm{~min}$.

Ethyl 2-(3-Aminopropanoylamino)-4-methyl-thiazole-5-carboxylate (48). Ethyl 2-[3-(tert-butoxycarbonylamino) propanoylamino]-4-methyl-thiazole-5-carboxylate $45(1.22 \mathrm{~g}, 3.41 \mathrm{mmol})$ was dissolved in $\mathrm{EtOH}(34 \mathrm{~mL})$, and to the mixture was added 4 N HCl in dioxane ( 17 $\mathrm{mL}, 68.27 \mathrm{mmol}$ ) dropwise while stirring at room temperature. The mixture was stirred 3 h at rt. The mixture was concentrated in vacuo. The residue was dissolved in EtOAc and washed with aq. sat. bicarb. $(\times 1)$ and brine $(\times 1)$. The aqueous layer was back-extracted with EtOAc ( $\times 2$ ). The combined organic layers were dried over sodium sulfate and concentrated in vacuo to give 48 ( $849 \mathrm{mg}, 97 \%, 3.30 \mathrm{mmol}$ ) as an off-white solid. The product was used as such in the next step. HPLC/MS (ESI): $m / z 258.0909[\mathrm{M}+\mathrm{H}]^{+} . R_{\mathrm{t}}(2 \mathrm{~min}): 0.84 \mathrm{~min}$.

Ethyl 4-Methyl-2-(3-(3-methylbenzamido)propanamido)-thiazole-5-carboxylate (2). To 3-methylbenzoic acid ( 38.1 mg , 0.280 mmol ), ethyl 2-(3-aminopropanoylamino)-4-methyl-thiazole-5carboxylate $48(80 \mathrm{mg}, 0.311 \mathrm{mmol})$, and DIPEA $(163 \mu \mathrm{~L}, 0.933$ mmol ) in DMF ( 3.1 mL ) was added HATU ( $110 \mathrm{mg}, 0.466 \mathrm{mmol}$ ), and the reaction mixture was stirred overnight at rt. The mixture was concentrated in vacuo. The crude was dissolved in EtOAc and washed with $1 \mathrm{NHCl}(\times 1)$, aq. sat. bicarb. $(\times 1)$, and brine $(\times 1)$. The organic layer was dried over sodium sulfate and concentrated in vacuo and purified by reverse phase column chromatography (eluent: $0-80 \%$ methanol/water, $+0.1 \%$ formic acid in each) to afford $2(83 \mathrm{mg}, 0.221$ $\mathrm{mmol}, 71 \%$ yield) as a colorless solid. ${ }^{1} \mathrm{H}$ NMR ( $\left.500 \mathrm{MHz}, \mathrm{DMSO}\right) ~ \delta$ $12.51(\mathrm{~s}, 1 \mathrm{H}), 8.55(\mathrm{t}, J=5.6 \mathrm{~Hz}, 1 \mathrm{H}), 7.65-7.62(\mathrm{~m}, 1 \mathrm{H}), 7.62-7.58$ $(\mathrm{m}, 1 \mathrm{H}), 7.34-7.31(\mathrm{~m}, 2 \mathrm{H}), 4.23(\mathrm{q}, J=7.1 \mathrm{~Hz}, 2 \mathrm{H}), 3.60-3.51(\mathrm{~m}$, $2 \mathrm{H}), 2.75(\mathrm{t}, J=6.9 \mathrm{~Hz}, 2 \mathrm{H}), 2.53(\mathrm{~s}, 3 \mathrm{H}), 2.34(\mathrm{~s}, 3 \mathrm{H}), 1.27(\mathrm{t}, J=7.1$ $\mathrm{Hz}, 3 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $\left.126 \mathrm{MHz}, \mathrm{DMSO}\right) \delta$ 171.04, 166.86, 162.60, 160.04, 156.57, 137.94, 134.80, 132.16, 128.60, 128.18, 124.76, 114.25, 60.92, 35.77, 35.62, 21.40, 17.49, 14.67. HPLC/HRMS (ESI): $m / z$ calculated for $\mathrm{C}_{18} \mathrm{H}_{22} \mathrm{~N}_{3} \mathrm{O}_{4} \mathrm{~S}^{+}[\mathrm{M}+\mathrm{H}]^{+}$376.1326, found 376.1328. $R_{\mathrm{t}}$ $(4 \mathrm{~min}): 2.80 \mathrm{~min}$.

Ethyl 4-Methyl-2-(3-(4-methylbenzamido)propanamido)-thiazole-5-carboxylate (4). Prepared as described for 2 using 4methylbenzoic acid $(28.6 \mathrm{mg}, 0.210 \mathrm{mmol})$ and $48(60 \mathrm{mg}, 0.233$ mmol ). The material isolated after column chromatography was further
purified by SCX-II ion exchange chromatography. Yield: 25 mg ( 0.067 mmol, $28.6 \%$ ) pale yellow solid. ${ }^{1} \mathrm{H}$ NMR ( 500 MHz , DMSO- $d_{6}$ ) $\delta$ $12.48(\mathrm{~s}, 1 \mathrm{H}), 8.51(\mathrm{t}, J=5.6 \mathrm{~Hz}, 1 \mathrm{H}), 7.75-7.69(\mathrm{~m}, 2 \mathrm{H}), 7.28-7.21$ $(\mathrm{m}, 2 \mathrm{H}), 4.23(\mathrm{q}, J=7.1 \mathrm{~Hz}, 2 \mathrm{H}), 3.55(\mathrm{td}, J=6.9,5.4 \mathrm{~Hz}, 2 \mathrm{H}), 2.75(\mathrm{t}$, $J=6.9 \mathrm{~Hz}, 2 \mathrm{H}), 2.53(\mathrm{~s}, 3 \mathrm{H}), 2.34(\mathrm{~s}, 3 \mathrm{H}), 1.27(\mathrm{t}, J=7.1 \mathrm{~Hz}, 3 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( 126 MHz, DMSO) $\delta 171.01,166.63,162.60,159.95,156.56$, 141.47, 131.99, 129.22, 127.63, 114.29, 60.93, 35.74, 35.62, 21.39, 17.49, 14.66. HPLC/HRMS (ESI): $m / z$ calculated for $\mathrm{C}_{18} \mathrm{H}_{22} \mathrm{~N}_{3} \mathrm{O}_{4} \mathrm{~S}^{+}$ $[\mathrm{M}+\mathrm{H}]^{+}$376.1326, found 376.1336. $\mathrm{R}_{\mathrm{t}}(4 \mathrm{~min}): 2.80 \mathrm{~min}$.

Ethyl 2-(3-(3-Ethylbenzamido)propanamido)-4-methylthiazole-5-carboxylate (5). Prepared as described for 2 using 3-ethylbenzoic acid ( $31.5 \mathrm{mg}, 0.210 \mathrm{mmol}$ ) and $48(60 \mathrm{mg}, 0.233 \mathrm{mmol})$. An additional washing step of the crude in EtOAc with $\mathrm{NaHCO}_{3}$ and brine was required. Yield: $53 \mathrm{mg}(0.136 \mathrm{mmol}, 58.4 \%)$ colorless solid. ${ }^{1} \mathrm{H}$ NMR ( $500 \mathrm{MHz}, \mathrm{DMSO}) \delta 12.51(\mathrm{~s}, 1 \mathrm{H}), 8.56(\mathrm{t}, J=5.6 \mathrm{~Hz}, 1 \mathrm{H})$, $7.67-7.65(\mathrm{~m}, 1 \mathrm{H}), 7.62$ (ddd, $J=5.4,3.9,1.8 \mathrm{~Hz}, 1 \mathrm{H}), 7.37-7.34(\mathrm{~m}$, $2 \mathrm{H}), 4.23(\mathrm{q}, J=7.1 \mathrm{~Hz}, 2 \mathrm{H}), 3.56(\mathrm{q}, J=6.7 \mathrm{~Hz}, 2 \mathrm{H}), 2.75(\mathrm{t}, J=6.9$ $\mathrm{Hz}, 2 \mathrm{H}), 2.64(\mathrm{q}, J=7.6 \mathrm{~Hz}, 2 \mathrm{H}), 2.53(\mathrm{~s}, 3 \mathrm{H}), 1.27(\mathrm{t}, J=7.1 \mathrm{~Hz}, 3 \mathrm{H})$, $1.19(\mathrm{t}, J=7.6 \mathrm{~Hz}, 3 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $\left.126 \mathrm{MHz}, \mathrm{DMSO}\right) \delta 170.54$, $166.45,162.13,159.50,156.10,143.79,134.41,130.59,128.20,126.55$, 124.56, 113.82, 60.46, 35.31, 35.16, 28.08, 17.02, 15.50, 14.20. HPLC/ HRMS (ESI): $m / z$ calculated for $\mathrm{C}_{19} \mathrm{H}_{24} \mathrm{~N}_{3} \mathrm{O}_{4} \mathrm{~S}^{+}[\mathrm{M}+\mathrm{H}]^{+} 390.1482$, found 390.1490. $R_{\mathrm{t}}(4 \mathrm{~min}): 2.93 \mathrm{~min}$.

Ethyl 2-(3-(3-Chlorobenzamido)propanamido)-4-methylthia-zole-5-carboxylate (6). Prepared as described for 2 using 3chlorobenzoic acid ( $32.9 \mathrm{mg}, 0.210 \mathrm{mmol}$ ) and $48(60 \mathrm{mg}, 0.233$ $\mathrm{mmol})$. An additional washing step of the crude in EtOAc with $\mathrm{NaHCO}_{3}$ and brine was required. Yield: $55 \mathrm{mg}(0.139 \mathrm{mmol}, 59.6 \%)$ colorless solid. ${ }^{1} \mathrm{H}$ NMR $\left(500 \mathrm{MHz}, \mathrm{DMSO}-d_{6}\right) \delta 12.52(\mathrm{~s}, 1 \mathrm{H}), 8.73$ $(\mathrm{t}, J=5.5 \mathrm{~Hz}, 1 \mathrm{H}), 7.86(\mathrm{t}, J=1.9 \mathrm{~Hz}, 1 \mathrm{H}), 7.78(\mathrm{dt}, J=7.8,1.3 \mathrm{~Hz}$, $1 \mathrm{H}), 7.59$ (ddd, $J=8.0,2.2,1.1 \mathrm{~Hz}, 1 \mathrm{H}), 7.50(\mathrm{t}, J=7.9 \mathrm{~Hz}, 1 \mathrm{H}), 4.23$ $(\mathrm{q}, J=7.1 \mathrm{~Hz}, 2 \mathrm{H}), 3.57(\mathrm{q}, J=6.6 \mathrm{~Hz}, 2 \mathrm{H}), 2.75(\mathrm{t}, J=6.8 \mathrm{~Hz}, 2 \mathrm{H})$, $2.53(\mathrm{~s}, 3 \mathrm{H}), 1.27(\mathrm{t}, J=7.1 \mathrm{~Hz}, 3 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $\left.126 \mathrm{MHz}, \mathrm{DMSO}\right) \delta$ $170.45,164.87,162.13,159.52,156.10,136.30,133.13,131.02,130.31$, 126.99, 125.96, 113.83, 60.47, 35.43, 34.99, 17.02, 14.20. HPLC/ HRMS (ESI): $m / z$ calculated for $\mathrm{C}_{17} \mathrm{H}_{19} \mathrm{ClN}_{3} \mathrm{O}_{4} \mathrm{~S}^{+}[\mathrm{M}+\mathrm{H}]^{+} 396.0779$, found 396.0782. $R_{\mathrm{t}}(4 \mathrm{~min}): 2.87 \mathrm{~min}$.

N-Ethyl-4-methyl-2-(3-(3-methylbenzamido)propanamido)-thiazole-5-carboxamide (7). Ethyl 4-methyl-2-(3-(3methylbenzamido) propanamido) thiazole-5-carboxylate 2 ( 93 mg , 0.248 mmol ) was dissolved in $\mathrm{MeOH} /$ water while stirring at room temperature. NaOH ( $198 \mathrm{mg}, 4.95 \mathrm{mmol}$ ) was added, and the mixture was stirred at $55^{\circ} \mathrm{C}$ for 1 h . It was then allowed to stir at rt overnight. The mixture was acidified with 2 N HCl and concentrated in vacuo. The residue was partitioned between water and EtOAc. The organic layer was washed with brine and dried over sodium sulfate. The crude product was purified by RP chromatography ( $0-60 \%$ methanol/water, $+0.1 \%$ formic acid) to give 4-methyl-2-(3-(3-methylbenzamido)-propanamido)thiazole-5-carboxylic acid $51(23 \mathrm{mg}, 0.066 \mathrm{mmol}$, $26.7 \%$ yield) as a colorless solid. The product was used as such in the next step. HPLC/MS (ESI): $m / z 348.1028[\mathrm{M}+\mathrm{H}]^{+} . R_{\mathrm{t}}(2 \mathrm{~min}): 1.13$ $\min$.

To a stirred solution of $\mathbf{5 1}(15 \mathrm{mg}, 0.043 \mathrm{mmol})$ and HOBt $(13.22$ $\mathrm{mg}, 0.086 \mathrm{mmol}$ ) in dry DMF at room temperature were added EDC $(16.6 \mathrm{mg}, 0.086 \mathrm{mmol})$, DIPEA ( $0.023 \mathrm{~mL}, 0.130 \mathrm{mmol}$ ), and ethylamine $\cdot \mathrm{HCl}(7.04 \mathrm{mg}, 0.086 \mathrm{mmol})$ sequentially. The mixture was stirred at rt for 2 h . The mixture was concentrated in vacuo. The crude product was dissolved in EtOAc and washed with water $(\times 1)$, aq. sat. bicarb. $(\times 1)$, and brine $(\times 1)$. The organic layer was dried over sodium sulfate and concentrated in vacuo. The crude product was purified by NP chromatography ( $0-2 \% \mathrm{MeOH} / \mathrm{EtOAc}$ ), followed by SCX-II ion exchange chromatography, to give 7 ( $7 \mathrm{mg}, 0.019 \mathrm{mmol}, 43.3 \%$ yield) as a colorless solid. ${ }^{1} \mathrm{H}$ NMR ( $\left.500 \mathrm{MHz}, \mathrm{DMSO}-d_{6}\right) \delta 12.29(\mathrm{~s}, 1 \mathrm{H})$, $8.54(\mathrm{t}, J=5.6 \mathrm{~Hz}, 1 \mathrm{H}), 7.96(\mathrm{t}, J=5.6 \mathrm{~Hz}, 1 \mathrm{H}), 7.64(\mathrm{t}, J=1.1 \mathrm{~Hz}, 1 \mathrm{H})$, 7.60 (ddd, $J=5.8,4.3,1.8 \mathrm{~Hz}, 1 \mathrm{H}), 7.35-7.30(\mathrm{~m}, 2 \mathrm{H}), 3.55(\mathrm{q}, J=6.7$ $\mathrm{Hz}, 2 \mathrm{H}), 3.20(\mathrm{qd}, J=7.4,5.7 \mathrm{~Hz}, 2 \mathrm{H}), 2.73(\mathrm{t}, J=6.9 \mathrm{~Hz}, 2 \mathrm{H}), 2.46(\mathrm{~s}$, $3 \mathrm{H}), 2.34(\mathrm{~s}, 3 \mathrm{H}), 1.08(\mathrm{t}, J=7.2 \mathrm{~Hz}, 3 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( 126 MHz , DMSO) $\delta 170.44,166.85,161.99,156.96,150.43,137.94,134.81$, 132.16, 128.60, 128.17, 124.75, 119.26, 35.86, 35.56, 34.48, 21.40,
17.35, 15.29. HPLC/HRMS (ESI): $m / z$ calculated for $\mathrm{C}_{18} \mathrm{H}_{23} \mathrm{~N}_{4} \mathrm{O}_{3} \mathrm{~S}^{+}$ $[\mathrm{M}+\mathrm{H}]^{+} 375.1485$, found 375.1477. $R_{\mathrm{t}}(4 \mathrm{~min}): 2.29 \mathrm{~min}$.

Ethyl 2-(3-Benzamidopropanamido)-4-methylthiazole-5-carboxylate (9). Prepared as described for 2 using benzoic acid ( $19.0 \mathrm{mg}, 0.156$ mmol, 1 equiv) and $48(40 \mathrm{mg}, 0.156 \mathrm{mmol})$. An additional washing step of the crude in EtOAc with $\mathrm{NaHCO}_{3}$ and brine was required. Yield: $36 \mathrm{mg}(0.100 \mathrm{mmol}, 64.1 \%)$, colorless solid. ${ }^{1} \mathrm{H}$ NMR ( 500 MHz, DMSO- $\left.d_{6}\right) \delta 12.52(\mathrm{~s}, 1 \mathrm{H}), 8.60(\mathrm{t}, J=5.6 \mathrm{~Hz}, 1 \mathrm{H}), 7.85-7.79$ $(\mathrm{m}, 2 \mathrm{H}), 7.54-7.49(\mathrm{~m}, 1 \mathrm{H}), 7.47-7.42(\mathrm{~m}, 2 \mathrm{H}), 4.23(\mathrm{q}, J=7.1 \mathrm{~Hz}$, $2 \mathrm{H}), 3.57(\mathrm{td}, J=6.8,5.4 \mathrm{~Hz}, 2 \mathrm{H}), 2.76(\mathrm{t}, J=6.8 \mathrm{~Hz}, 2 \mathrm{H}), 2.53(\mathrm{~s}, 3 \mathrm{H})$, $1.27(\mathrm{t}, J=7.1 \mathrm{~Hz}, 3 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( 126 MHz , DMSO) $\delta 170.52$, 166.30, 162.13, 159.48, 156.10, 134.32, 131.17, 128.25, 127.15, 113.85, 60.48, 35.33, 35.12, 17.03, 14.21. HPLC/HRMS (ESI): $m / z$ calculated for $\mathrm{C}_{17} \mathrm{H}_{20} \mathrm{~N}_{3} \mathrm{O}_{4} \mathrm{~S}^{+}[\mathrm{M}+\mathrm{H}]^{+} 362.1169$, found 362.1171. $R_{\mathrm{t}}(4 \mathrm{~min})$ : 2.63 min .

Ethyl 4-Methyl-2-(3-(3-methylcyclohexane-1-carboxamido)-propanamido)thiazole-5-carboxylate (10). Prepared as described for 2 using 3-methylcyclohexanecarboxylic acid ( $22.1 \mathrm{mg}, 0.156 \mathrm{mmol}$ ) and $48(40.0 \mathrm{mg}, 0.156 \mathrm{mmol})$. The crude product was purified by NP chromatography ( $0-2 \% \mathrm{MeOH} / \mathrm{DCM}$ ). Yield: 47 mg ( 0.123 mmol , $79.3 \%$ ), yellowish solid. (Note: mixture of inseparable diastereomers) ${ }^{1} \mathrm{H}$ NMR ( 500 MHz, DMSO- $d_{6}$ ) $\delta 12.44(\mathrm{~s}, 1 \mathrm{H}), 7.88-7.71(\mathrm{~m}, 1 \mathrm{H})$, $4.23(\mathrm{q}, J=7.1 \mathrm{~Hz}, 2 \mathrm{H}), 2.63-2.56(\mathrm{~m}, 2 \mathrm{H}), 2.53(\mathrm{~s}, 3 \mathrm{H}), 2.34(\mathrm{dt}, J=$ $7.6,3.8 \mathrm{~Hz}, 0.6 \mathrm{H}), 2.11-2.03(\mathrm{~m}, 0.7 \mathrm{H}), 1.83-1.74(\mathrm{~m}, 0.3 \mathrm{H}), 1.71-$ $1.36(\mathrm{~m}, 5.1 \mathrm{H}), 1.34-1.29(\mathrm{~m}, 0.6 \mathrm{H}), 1.27(\mathrm{t}, J=7.1 \mathrm{~Hz}, 3.3 \mathrm{H}), 1.24-$ $1.04(\mathrm{~m}, 2.6 \mathrm{H}), 0.93(\mathrm{q}, J=12.2 \mathrm{~Hz}, 0.8 \mathrm{H}), 0.86-0.81(\mathrm{~m}, 3.2 \mathrm{H})$, $0.81-0.70(\mathrm{~m}, 0.8 \mathrm{H})$. Ethyl 4-Methyl-2-(3-(3-(2-methyl-2H-tetrazol-5-yl)benzamido)-propanamido)thiazole-5-carboxylate (18). Prepared as described for 2 using 3-(2-methyltetrazol-5-yl)benzoic acid ( $31.7 \mathrm{mg}, 0.156$ $\mathrm{mmol})$ and $48(40 \mathrm{mg}, 0.155 \mathrm{mmol})$. The mixture was diluted with EtOAc and washed with water $(\times 1)$, aq. sat. bicarb. $(\times 1)$, and brine $(\times 1)$. The organic layer was dried over magnesium sulfate and concentrated in vacuo. The crude product was purified by RP chromatography ( $30-100 \%$ methanol/water $+0.1 \%$ formic acid). Yield: $21 \mathrm{mg}(0.0474 \mathrm{mmol}, 30.0 \%)$, white powder. ${ }^{1} \mathrm{H}$ NMR ( 500 MHz, DMSO- $\left.d_{6}\right) \delta 12.54(\mathrm{~s}, 1 \mathrm{H}), 8.86(\mathrm{t}, J=5.5 \mathrm{~Hz}, 1 \mathrm{H}), 8.52(\mathrm{t}, J=$ $1.7 \mathrm{~Hz}, 1 \mathrm{H}), 8.19(\mathrm{dt}, J=7.7,1.3 \mathrm{~Hz}, 1 \mathrm{H}), 7.98(\mathrm{dt}, J=7.9,1.3 \mathrm{~Hz}, 1 \mathrm{H})$, $7.66(\mathrm{t}, J=7.8 \mathrm{~Hz}, 1 \mathrm{H}), 4.45(\mathrm{~s}, 3 \mathrm{H}), 4.23(\mathrm{q}, J=7.1 \mathrm{~Hz}, 2 \mathrm{H}), 3.60(\mathrm{q}, J$ $=6.5 \mathrm{~Hz}, 2 \mathrm{H}), 2.79(\mathrm{t}, J=6.8 \mathrm{~Hz}, 2 \mathrm{H}), 2.53(\mathrm{~s}, 3 \mathrm{H}), 1.27(\mathrm{t}, J=7.1 \mathrm{~Hz}$, $3 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $126 \mathrm{MHz}, \mathrm{DMSO}$ ) $\delta 170.55,165.56,163.67$, 162.14, $159.57,156.11,135.26,129.40,129.14,128.82,127.04,125.10,113.80$, $60.47,35.46,35.09,17.03,14.21(1 \times \mathrm{C}$ underneath solvent peak). HPLC/HRMS (ESI): $m / z$ calculated for $\mathrm{C}_{19} \mathrm{H}_{22} \mathrm{~N}_{7} \mathrm{O}_{4} \mathrm{~S}^{+}[\mathrm{M}+\mathrm{H}]^{+}$ 444.1448, found 444.1442. $R_{\mathrm{t}}(4 \mathrm{~min}): 3.12 \mathrm{~min}$.

Methyl 3-(3-(5-Methyl-1,2,4-oxadiazol-3-yl)benzamido)propanoate (57). To methyl 3-aminopropanoate hydrochloride (547 $\mathrm{mg}, 3.9 \mathrm{mmol}$ ) and 3-(5-methyl-1,2,4-oxadiazol-3-yl) benzoic acid (800 $\mathrm{mg}, 3.9 \mathrm{mmol})$ in DMF ( 20 mL ) was added DIPEA ( 2.7 mL , 15.7 $\mathrm{mmol})$, followed by HATU $(1.38 \mathrm{~g}, 5.9 \mathrm{mmol})$. The obtained yellow solution was stirred at rt for 20 h . The reaction mixture was diluted with ethyl acetate $(200 \mathrm{~mL})$ and washed with water $(250 \mathrm{~mL})$. The aqueous phase was extracted with fresh ethyl acetate $(100 \mathrm{~mL})$. The combined organic layers were washed with aqueous saturated sodium bicarbonate solution ( 150 mL ) and brine ( 200 mL ), then dried over $\mathrm{MgSO}_{4}$. Filtering and concentrating in vacuo afforded methyl 3-(3-(5-methyl-1,2,4-oxadiazol-3-yl)benzamido)propanoate ( $1.12 \mathrm{~g}, 99 \%$, 3.9 mmol ) as an off-white colored amorphous powder. ${ }^{1} \mathrm{H}$ NMR $(500 \mathrm{MHz}$, $\left.\mathrm{CDCl}_{3}\right) \delta 8.40(\mathrm{td}, J=1.8,0.5 \mathrm{~Hz}, 1 \mathrm{H}), 8.19(\mathrm{dt}, J=7.8,1.4 \mathrm{~Hz}, 1 \mathrm{H})$, 7.95 (ddd, $J=7.8,1.9,1.2 \mathrm{~Hz}, 1 \mathrm{H}), 7.57(\mathrm{td}, J=7.8,0.6 \mathrm{~Hz}, 1 \mathrm{H}), 6.90$ $(\mathrm{s}, 1 \mathrm{H}), 3.76(\mathrm{q}, J=6.0 \mathrm{~Hz}, 2 \mathrm{H}), 3.73(\mathrm{~s}, 3 \mathrm{H}), 2.70-2.66(\mathrm{~m}, 5 \mathrm{H})$; HPLC/MS (ESI): $m / z 312.0963[\mathrm{M}+\mathrm{Na}]^{+} . R_{\mathrm{t}}(2 \mathrm{~min}): 1.02 \mathrm{~min}$.

3-(3-(5-Methyl-1,2,4-oxadiazol-3-yl)benzamido)propanoic Acid (60). To methyl 3-(3-(5-methyl-1,2,4-oxadiazol-3-yl)benzamido)propanoate $58(200.0 \mathrm{mg}, 0.691 \mathrm{mmol})$ in THF ( 3.46 mL ) was added water $(3.46 \mathrm{~mL})$, followed by lithium hydroxide hydrate (116.0 $\mathrm{mg}, 2.77 \mathrm{mmol})$. After stirring for 1.5 h , to the mixture was added water $(20 \mathrm{~mL})$, and the THF was removed in vacuo. The solution was acidified with 1 N citric acid solution and extracted with EtOAc $(2 \times 30$ $\mathrm{mL})$. The organics were combined, washed with brine and dried over $\mathrm{MgSO}_{4}$. This gave 3-(3-(5-methyl-1,2,4-oxadiazol-3-yl)benzamido)propanoic acid ( $174 \mathrm{mg}, 91 \%, 0.632 \mathrm{mmol}$ ) as a colorless solid. No further purification was performed. ${ }^{1} \mathrm{H}$ NMR $\left(500 \mathrm{MHz}, \mathrm{DMSO}-d_{6}\right) \delta$ $12.22($ brs, 1 H$), 8.78(\mathrm{brt}, J=5.4 \mathrm{~Hz}, 1 \mathrm{H}), 8.46(\mathrm{t}, J=1.7 \mathrm{~Hz}, 1 \mathrm{H}), 8-$ $14-8.12(\mathrm{~m}, 1 \mathrm{H}), 8.07-7.95(\mathrm{~m}, 1 \mathrm{H}), 7.66(\mathrm{t}, J=7.8 \mathrm{~Hz}, 1 \mathrm{H}), 3.50-$ $3.46(\mathrm{~m}, 2 \mathrm{H}), 2.69(\mathrm{~s}, 3 \mathrm{H}), 2.54(\mathrm{t}, J=7.1 \mathrm{~Hz}, 2 \mathrm{H})$. 3-(5-Methyl-1,2,4-oxadiazol-3-yl)-N-(3-((4-methylthiazol-2-yl)-amino)-3-oxopropyl)benzamide (20). Prepared as described for 19 using 4-methylthiazol-2-amine ( $12.30 \mathrm{mg}, 0.1078 \mathrm{mmol}$ ), EDC• HCl (2 equiv) instead of EDC, and $60(25.0 \mathrm{mg}, 0.0908 \mathrm{mmol})$. The reaction mixture was partitioned between water $(50 \mathrm{~mL})$ and EtOAc $(40 \mathrm{~mL})$. The organic layer was washed with water ( 40 mL ), aq. sat. bicarb. (20 $\mathrm{mL})$, and brine $(20 \mathrm{~mL})$. The organic layer was dried over $\mathrm{MgSO}_{4}$ and concentrated in vacuo before purification. Yield: $13 \mathrm{mg}(0.0350 \mathrm{mmol}$, $39.0 \%$ ), white powder. ${ }^{1} \mathrm{H} \operatorname{NMR}\left(500 \mathrm{MHz}, \mathrm{DMSO}-d_{6}\right) \delta 12.07$ (s, $1 \mathrm{H}), 8.87(\mathrm{t}, J=5.5 \mathrm{~Hz}, 1 \mathrm{H}), 8.47(\mathrm{~d}, J=1.8 \mathrm{~Hz}, 1 \mathrm{H}), 8.19-8.09(\mathrm{~m}$, $1 \mathrm{H}), 8.03(\mathrm{dt}, J=7.8,1.5 \mathrm{~Hz}, 1 \mathrm{H}), 7.65(\mathrm{t}, J=7.8 \mathrm{~Hz}, 1 \mathrm{H}), 6.72(\mathrm{~s}, 1 \mathrm{H})$, $3.59(\mathrm{dt}, J=6.6 \mathrm{~Hz}, 2 \mathrm{H}), 2.74(\mathrm{t}, J=6.9 \mathrm{~Hz}, 2 \mathrm{H}), 2.68(\mathrm{~s}, 3 \mathrm{H}), 2.24(\mathrm{~d}, J$ $=1.1 \mathrm{~Hz}, 3 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( 126 MHz , DMSO) $\delta 178.14,169.85,167.72$, 165.86, 157.63, 146.97, 135.71, 130.54, 129.89, 129.82, 126.88, 126.23, 107.95, 36.05, 35.39, 17.33, 12.51. HPLC/HRMS (ESI): $m / z$ calculated for $\mathrm{C}_{17} \mathrm{H}_{18} \mathrm{~N}_{5} \mathrm{O}_{3} \mathrm{~S}^{+}[\mathrm{M}+\mathrm{H}]^{+}$372.1125, found 372.1135 . $R_{\mathrm{t}}(4 \mathrm{~min}): 2.92 \mathrm{~min}$.

Ethyl 4-Methyl-2-(2-(3-(5-methyl-1,2,4-oxadiazol-3-yl)-benzamido)acetamido)thiazole-5-carboxylate (21). To methyl 2aminoacetate hydrochloride ( $87.0 \mathrm{mg}, 0.693 \mathrm{mmol}$ ) and 3-(5-methyl-1,2,4-oxadiazol-3-yl)benzoic acid ( $141.5 \mathrm{mg}, 0.693 \mathrm{mmol}$ ) in DMF $(3.47 \mathrm{~mL})$ was added DIPEA ( $0.48 \mathrm{~mL}, 2.77 \mathrm{mmol}$ ), followed by HATU ( $395.3 \mathrm{mg}, 1.040 \mathrm{mmol}$ ). The reaction mixture was stirred at rt for 4 h . The mixture was diluted with $\mathrm{EtOAc}(20 \mathrm{~mL})$ and washed twice with water ( 15 mL each time). The water was extracted with EtOAc (15 $\mathrm{mL})$. The organic layers were combined and washed with aq. sat. bicarb. $(20 \mathrm{~mL})$ and brine $(20 \mathrm{~mL})$, then dried over $\mathrm{MgSO}_{4}$. After filtration and concentration in vacuo, the methyl (3-(5-methyl-1,2,4-oxadiazol-3yl)benzoyl)glycinate ( $185 \mathrm{mg}, 97 \%, 0.672 \mathrm{mmol}$ ) was isolated as an orange oil. The product 56 was directly used in the next step without further purification. HPLC/MS (ESI): $m / z 276.0957[\mathrm{M}+\mathrm{H}]^{+} . R_{\mathrm{t}}(2$ min ): 1.16 min .

To $56(170.0 \mathrm{mg}, 0.618 \mathrm{mmol})$ in THF ( $3.09 \mathrm{~mL}, 0.100 \mathrm{M}$ ) was added water $(3.09 \mathrm{~mL}, 0.100 \mathrm{M})$, followed by LiOH hydrate $(103.7 \mathrm{mg}$, $2.47 \mathrm{mmol})$. The solution was stirred at rt for 1.5 h . To the mixture was added water ( 15 mL ), and THF was removed in vacuo. The residue was washed with $\mathrm{EtOAc}(15 \mathrm{~mL})$. The aqueous phase was acidified using a HCl 1 N solution and then extracted with EtOAc $(20 \mathrm{~mL})$. The organic layers were combined, washed with brine, dried over $\mathrm{MgSO}_{4}$, and concentrated under reduced pressure to afford 59 ( $140 \mathrm{mg}, 87 \%, 0.536$ mmol ) as a colorless solid, which was used directly in the next step without further purification. HPLC/MS (ESI): $m / z 262.0810$ [M + $\mathrm{H}]^{+} . R_{\mathrm{t}}(2 \mathrm{~min}): 1.04 \mathrm{~min}$.

Preparation of 21 was performed as described for 19 using ethyl 2-amino-4-methyl-thiazole-5-carboxylate ( $27.5 \mathrm{mg}, 0.147 \mathrm{mmol}$ ), EDC• HCl ( 2 equiv) instead of EDC, and 59 ( $35.0 \mathrm{mg}, 0.134 \mathrm{mmol}$ ). The reaction mixture was partitioned between water ( 25 mL ) and EtOAc $(25 \mathrm{~mL})$. The organic phase was washed with water $(20 \mathrm{~mL})$, aq. sat. bicarb. $(20 \mathrm{~mL})$, and brine $(20 \mathrm{~mL})$, dried over $\mathrm{MgSO}_{4}$, and concentrated before purification. Yield: $25.2 \mathrm{mg}(0.0587 \mathrm{mmol}$, $44.0 \%$ ), colorless solid. ${ }^{1} \mathrm{H}$ NMR ( $500 \mathrm{MHz}, \mathrm{DMSO}-d_{6}$ ) $\delta 12.69$ (broad s, 1 H ), $9.20(\mathrm{t}, J=5.7 \mathrm{~Hz}, 1 \mathrm{H}), 8.54(\mathrm{t}, J=1.8 \mathrm{~Hz}, 1 \mathrm{H}), 8.17(\mathrm{dt}$, $J=1.4,7.8 \mathrm{~Hz}, 1 \mathrm{H}), 8.09(\mathrm{dt}, J=1.4,7.9 \mathrm{~Hz}, 1 \mathrm{H}), 7.70(\mathrm{t}, J=7.8 \mathrm{~Hz}$, $1 \mathrm{H}), 4.26-4.19(\mathrm{~m}, 4 \mathrm{H}), 2.69(\mathrm{~s}, 3 \mathrm{H}), 2.55(\mathrm{~s}, 3 \mathrm{H}), 1.27(\mathrm{t}, J=7.1 \mathrm{~Hz}$, $3 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $\left.126 \mathrm{MHz}, \mathrm{DMSO}\right) \delta 178.20,169.62,167.69,166.36$, 162.56, 160.25, 156.67, 135.07, 130.71, 130.21, 129.96, 126.97, 126.37, 114.38, 60.94, 43.33, 17.51, 14.65, 12.53. HPLC/HRMS (ESI): $m / z$ calculated for $\mathrm{C}_{19} \mathrm{H}_{20} \mathrm{~N}_{5} \mathrm{O}_{5} \mathrm{~S}^{+}[\mathrm{M}+\mathrm{H}]^{+}$430.1180, found 430.1173. $R_{\mathrm{t}}$ ( 4 min ): 2.78 min .

Ethyl 2-(4-((tert-Butoxycarbonyl)amino)butanamido)-4-methyl-thiazole-5-carboxylate (46). To a solution of ethyl 2-amino-4-methyl-thiazole-5-carboxylate ( $108.7 \mathrm{mg}, 0.584 \mathrm{mmol}$ ) and 4 -(tert-
butoxycarbonylamino) butanoic acid ( $100.0 \mathrm{mg}, 0.492 \mathrm{mmol}$ ) in DMF $(2.46 \mathrm{~mL}, 0.200 \mathrm{M})$ were added HOBt $(133.0 \mathrm{mg}, 0.984 \mathrm{mmol})$ and EDC ( $152.8 \mathrm{mg}, 0.984 \mathrm{mmol}$ ). The mixture was stirred for 18.5 h at 60 ${ }^{\circ} \mathrm{C}$. The reaction mixture was partitioned between water $(100 \mathrm{~mL})$ and $\operatorname{EtOAc}(100 \mathrm{~mL})$. The organic layer was washed with water $(100 \mathrm{~mL})$, $1 \mathrm{~N} \mathrm{HCl}(50 \mathrm{~mL})$, aq. sat. bicarb. $(75 \mathrm{~mL})$, and brine ( 80 mL ). The organic layer was dried over $\mathrm{MgSO}_{4}$ and concentrated under reduced pressure to give ethyl 2-[4-(tert-butoxycarbonylamino)-butanoylamino]-4-methyl-thiazole-5-carboxylate $(145.7 \mathrm{mg}, 80 \%$, 0.392 mmol ) as a sticky yellow foam. ${ }^{1} \mathrm{H}$ NMR ( 500 MHz , chloroform-d) $\delta 4.80($ brs, 1 H$), 4.33(\mathrm{q}, J=7.1 \mathrm{~Hz}, 2 \mathrm{H}), 3.25(\mathrm{~d}, J=$ $6.6 \mathrm{~Hz}, 2 \mathrm{H}), 2.66(\mathrm{~s}, 3 \mathrm{H}), 2.62-2.50(\mathrm{~m}, 2 \mathrm{H}), 1.94(\mathrm{t}, J=6.7 \mathrm{~Hz}, 2 \mathrm{H})$, $1.46(\mathrm{~s}, 9 \mathrm{H}), 1.37(\mathrm{t}, J=7.1 \mathrm{~Hz}, 3 \mathrm{H})$. HPLC/MS (ESI): $m / z 394.1413$ $[\mathrm{M}+\mathrm{Na}]^{+} . R_{\mathrm{t}}(2 \mathrm{~min}): 1.34 \mathrm{~min}$. HPLC/HRMS (ESI): $\mathrm{m} / z$ calculated for $\mathrm{C}_{16} \mathrm{H}_{25} \mathrm{~N}_{3} \mathrm{O}_{5} \mathrm{SNa}^{+}[\mathrm{M}+\mathrm{Na}]^{+}$394.1407, found 394.1403. $R_{\mathrm{t}}$ (4 $\mathrm{min}): 2.84 \mathrm{~min}$.

Ethyl 2-(4-Aminobutanamido)-4-methylthiazole-5-carboxylate (49). 4 N HCl in dioxane ( $2.95 \mathrm{~mL}, 11.8 \mathrm{mmol}$ ) was added dropwise to a solution of ethyl 2-[4-(tert-butoxycarbonylamino)butanoylamino]-4-methyl-thiazole-5-carboxylate 46 ( $146.0 \mathrm{mg}, 0.393 \mathrm{mmol}$ ) in EtOH $(3.9 \mathrm{~mL})$. The reaction mixture was left stirring at rt . The volatiles were evaporated to dryness. The residue was dissolved in DCM $(50 \mathrm{~mL})$ and washed with aq. sat. bicarb. $(1 \times 75 \mathrm{~mL})$ and brine $(1 \times 75 \mathrm{~mL})$. The organic layer was dried over $\mathrm{MgSO}_{4}$ and concentrated in vacuo to give ethyl 2-(4-aminobutanoylamino)-4-methyl-thiazole-5-carboxylate 49 $(36 \mathrm{mg}, 34 \%, 0.133 \mathrm{mmol})$ as a yellow film. This was taken through to the next step without further purification. HPLC/MS (ESI): $m / z$ $294.0887[\mathrm{M}+\mathrm{Na}]^{+} . R_{\mathrm{t}}(2 \mathrm{~min}): 0.84 \mathrm{~min}$.

Ethyl 4-Methyl-2-(4-(3-(5-methyl-1,2,4-oxadiazol-3-yl)-benzamido)butanamido)thiazole-5-carboxylate (22). Prepared as described for 2 using 3 -(5-methyl-1,2,4-oxadiazol-3-yl)benzoic acid ( $26.3 \mathrm{mg}, 0.129 \mathrm{mmol}$ ), ethyl 2-(4-aminobutanamido)-4-methylthia-zole-5-carboxylate $49(35.0 \mathrm{mg}, 0.129 \mathrm{mmol})$ and DIPEA ( $68 \mu \mathrm{~L}, 0.387$ $\mathrm{mmol})$ in DMF ( 1.29 mL ). HATU ( $215 \mathrm{mg}, 0.910 \mathrm{mmol}$ ) was added, and the mixture was stirred overnight at rt. Yield: $53 \mathrm{mg}(0.136 \mathrm{mmol}$, $58.4 \%$ ), colorless solid. The crude product was purified by RP chromatography ( $30-100 \%$ methanol/water $+0.1 \%$ formic acid). Yield: 18.7 mg ( $0.0409 \mathrm{mmol}, 32.0 \%$ ), white solid. ${ }^{1}$ H NMR ( 500 MHz , DMSO- $d_{6}$ ) $\delta 12.44(\mathrm{~s}, 1 \mathrm{H}), 8.71(\mathrm{t}, J=5.6 \mathrm{~Hz}, 1 \mathrm{H}), 8.45(\mathrm{t}, J=1.7 \mathrm{~Hz}$, $1 \mathrm{H}), 8.11(\mathrm{dt}, J=7.7,1.4 \mathrm{~Hz}, 1 \mathrm{H}), 8.06-7.99(\mathrm{~m}, 1 \mathrm{H}), 7.64(\mathrm{t}, J=7.8$ $\mathrm{Hz}, 1 \mathrm{H}), 4.22(\mathrm{q}, J=7.1 \mathrm{~Hz}, 2 \mathrm{H}), 3.37-3.33(\mathrm{~m}, 2 \mathrm{H}), 2.68(\mathrm{~s}, 3 \mathrm{H})$, $2.54-2.52(\mathrm{~m}, J=8.6 \mathrm{~Hz}, 5 \mathrm{H}), 1.89(\mathrm{p}, J=7.0 \mathrm{~Hz}, 2 \mathrm{H}), 1.27(\mathrm{t}, J=7.1$ $\mathrm{Hz}, 3 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( 126 MHz , DMSO) $\delta$ 178.1, 172.4, 167.7, 165.8, $162.6,160.1,156.6,135.9,130.5,129.8,129.7,126.8,126.2,114.2,60.9$, 39.1, 33.0, 24.8, 17.5, 14.7, 12.5 ppm . HPLC/MS (ESI): $m / z 458.0937$ $[\mathrm{M}+\mathrm{H}]^{+} . R_{\mathrm{t}}(2 \mathrm{~min}): 1.29 \mathrm{~min}$. HPLC/HRMS (ESI): $m / z$ calculated for $\mathrm{C}_{21} \mathrm{H}_{24} \mathrm{~N}_{5} \mathrm{O}_{5} \mathrm{~S}^{+}[\mathrm{M}+\mathrm{H}]^{+}$458.1493, found 458.1493. $R_{\mathrm{t}}(4 \mathrm{~min})$ : 2.72 min .

Ethyl 4-Methyl-2-(N-methyl-3-(3-(5-methyl-1,2,4-oxadiazol-3-yl)-benzamido)propanamido)thiazole-5-carboxylate (23). To a stirred solution of 3-(tert-butoxycarbonylamino) propanoic acid ( $430 \mathrm{mg}, 2.27$ mmol ) and HOBt ( $614 \mathrm{mg}, 4.55 \mathrm{mmol}$ ) in dry DMF ( $11.36 \mathrm{~mL}, 0.200$ M) under a nitrogen atmosphere at rt were added EDC $(705.6 \mathrm{mg}, 4.55$ mmol ) and ethyl 4-methyl-2-(methylamino)thiazole-5-carboxylate $(540.0 \mathrm{mg}, 2.70 \mathrm{mmol})$ sequentially. The mixture was stirred for 18 h at $60^{\circ} \mathrm{C}$. The reaction mixture was partitioned between water $(50 \mathrm{~mL})$ and EtOAc $(40 \mathrm{~mL})$. The organic layer was washed with water ( 40 mL ), aq. sat. bicarb. $(20 \mathrm{~mL})$, and brine $(20 \mathrm{~mL})$. The organic layer was dried over sodium sulfate and concentrated in vacuo to give $47(798 \mathrm{mg}, 95 \%$, 2.15 mmol ) as a yellow solid. HPLC/MS (ESI): $m / z 372.1569$ [M + $\mathrm{H}]^{+} . R_{\mathrm{t}}(2 \mathrm{~min}): 1.54 \mathrm{~min}$.
Ethyl 2-(3-((tert-butoxycarbonyl)amino)- N -methylpropanamido)-4-methylthiazole-5-carboxylate 47 ( $400.00 \mathrm{mg}, 1.08 \mathrm{mmol}$ ) was dissolved in dioxane $(5.38 \mathrm{~mL})$. To the solution was added 4 M HCl in dioxane ( $5.38 \mathrm{~mL}, 21.5 \mathrm{mmol}$ ) dropwise while stirring at rt. After 2 h , volatiles were removed in vacuo. The crude ethyl 2-(3-((tert-butoxycarbonyl)amino)- N -methylpropanamido)-4-methylthiazole-5carboxylate 50 was used immediately in the next step to avoid decomposition. HPLC/MS (ESI): $m / z 272.1145[\mathrm{M}+\mathrm{H}]^{+} . R_{\mathrm{t}}(2$ $\mathrm{min}): 0.94 \mathrm{~min}$.

Preparation of $\mathbf{2 3}$ was performed as described for 2 using 50 (292.0 $\mathrm{mg}, 1.08 \mathrm{mmol}$ ) and 3-(5-methyl-1,2,4-oxadiazol-3-yl) benzoic acid 55 $(219.7 \mathrm{mg}, 1.08 \mathrm{mmol})$. The reaction mixture was diluted with EtOAc and washed with water ( $\times 1$ ), aq. sat. bicarb. $(\times 1)$, and brine $(\times 1)$. The organic layer was dried over magnesium sulfate and concentrated in vacuo to give a yellow colored crude $(469 \mathrm{mg}) .90 \mathrm{mg}$ of this material was purified by RP chromatography ( $30-80 \%$ methanol/water $+0.1 \%$ formic acid). Yield: $40 \mathrm{mg}(0.0874 \mathrm{mmol}, 8 \%)$, white powder. ${ }^{1} \mathrm{H}$ NMR $\left(500 \mathrm{MHz}\right.$, DMSO- $d_{6}$ ) $\delta 8.8(\mathrm{t}, J=5.4 \mathrm{~Hz}, 1 \mathrm{H}) .8 .5(\mathrm{td}, J=0.6,1.8 \mathrm{~Hz}$, $1 \mathrm{H}), 8.1-8.2(\mathrm{~m}, 1 \mathrm{H}), 8.0$ (ddd, $J=1.1,1.8,7.8 \mathrm{~Hz}, 1 \mathrm{H}), 7.6-7.7(\mathrm{~m}$, $1 \mathrm{H}), 4.2(\mathrm{q}, J=7.1 \mathrm{~Hz}, 2 \mathrm{H}), 3.6-3.7(\mathrm{~m}, 5 \mathrm{H}), 3.1(\mathrm{t}, J=6.8 \mathrm{~Hz}, 2 \mathrm{H})$, $2.7(\mathrm{~s}, 3 \mathrm{H}), 2.6(\mathrm{~s}, 3 \mathrm{H}), 1.3(\mathrm{t}, J=7.1 \mathrm{~Hz}, 3 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR $(126 \mathrm{MHz}$, DMSO) $\delta 178.2,172.6,167.7,165.9,162.8,160.7,155.4,135.7,130.6$, 129.9, 129.9, 126.9, 126.2, 115.7, 61.0, 35.7, 34.6, 34.3, 17.7, 14.6, 12.5. HPLC/HRMS (ESI): $m / z$ calculated for $\mathrm{C}_{21} \mathrm{H}_{24} \mathrm{~N}_{5} \mathrm{O}_{5} \mathrm{~S}^{+}[\mathrm{M}+\mathrm{H}]^{+}$ 458.1493, found 458.1505. $R_{\mathrm{t}}(4 \mathrm{~min}): 3.23 \mathrm{~min}$.

Ethyl 4-Methyl-2-(3-(N-methyl-3-(5-methyl-1,2,4-oxadiazol-3-yl)-benzamido)propanamido)thiazole-5-carboxylate (24). To methyl 3 -(methylamino) propanoate ( $0.16 \mathrm{~mL}, 1.22 \mathrm{mmol}$ ) and 3-( 5 -methyl-1,2,4-oxadiazol-3-yl) benzoic acid ( $250 \mathrm{mg}, 1.22 \mathrm{mmol}$ ) in DMF ( 6.12 mL ) was added DIPEA ( $0.64 \mathrm{~mL}, 3.67 \mathrm{mmol}$ ), followed by HATU $(698 \mathrm{mg}, 1.84 \mathrm{mmol})$. The reaction mixture was stirred at rt for a 48 h . The mixture was diluted with EtOAc $(25 \mathrm{~mL})$ and washed with water $(30 \mathrm{~mL})$. The water was extracted with EtOAc $(15 \mathrm{~mL})$. The organic layers were combined and washed with aq. sat. bicarb. $(50 \mathrm{~mL})$ and brine ( 50 mL ), then dried over $\mathrm{MgSO}_{4}$. After filtration and concentration in vacuo, methyl 3 - N -methyl-3-( 5 -methyl-1,2,4-oxadia-zol-3-yl)benzamido)propanoate ( $300 \mathrm{mg}, 81 \%, 0.990 \mathrm{mmol}$ ) was isolated as an orange oil. The product methyl 3-( N -methyl-3-(5-methyl-1,2,4-oxadiazol-3-yl)benzamido)propanoate 58 was directly used in the next step without further purification. HPLC/MS (ESI): $m / z 304.1297[\mathrm{M}+\mathrm{H}]^{+} . R_{\mathrm{t}}(2 \mathrm{~min}): 1.22 \mathrm{~min}$.

To methyl 3-(N-methyl-3-(5-methyl-1,2,4-oxadiazol-3-yl)benzamido)propanoate $58(300.0 \mathrm{mg}, 0.989 \mathrm{mmol})$ in THF ( 3.30 $\mathrm{mL}, 0.150 \mathrm{M})$ was added water ( $3.30 \mathrm{~mL}, 0.150 \mathrm{M}$ ), followed by lithium hydroxide hydrate ( $166 \mathrm{mg}, 3.96 \mathrm{mmol}$ ). The solution was stirred at rt for 1.5 h . To the solution was added water ( 15 mL ), THF was removed in vacuo, and the residue was washed with EtOAc (15 mL ). The aqueous phase was acidified using a 1 N HCl solution and then extracted with EtOAc ( 20 mL ). The organic layers were combined, washed with brine, dried over $\mathrm{MgSO}_{4}$, and concentrated under reduced pressure to afford 3-( N -methyl-3-(5-methyl-1,2,4-oxadiazol-3-yl)benzamido)propanoic acid $61(205 \mathrm{mg}, 72 \%, 0.709$ mmol ) as a colorless solid. 3-( N -methyl-3-( 5 -methyl-1,2,4-oxadiazol-3yl)benzamido)propanoic acid was used directly in the next without further purification. HPLC/MS (ESI): $m / z 290.1129[\mathrm{M}+\mathrm{H}]^{+} . R_{\mathrm{t}}(2$ $\mathrm{min}): 1.12 \mathrm{~min}$.

Preparation of 24 was performed as described for 19 using 4-methylthiazol-2-amine $(24.8 \mathrm{mg}, 0.133 \mathrm{mmol})$ and $\mathbf{6 1}(35.0 \mathrm{mg}, 0.121$ $\mathrm{mmol})$. Yield: $27.5 \mathrm{mg}(0.0601 \mathrm{mmol}, 50.0 \%)$ colorless solid. Note: rotamers were present. ${ }^{1} \mathrm{H}$ NMR ( $\left.500 \mathrm{MHz}, \mathrm{DMSO}\right) \delta 12.55(\mathrm{~s}, 1 \mathrm{H})$, $8.08-7.75(\mathrm{~m}, 2 \mathrm{H}), 7.67-7.49(\mathrm{~m}, 2 \mathrm{H}), 4.23(\mathrm{q}, J=7.1 \mathrm{~Hz}, 2 \mathrm{H})$, $3.85-3.58(\mathrm{~m}, 2 \mathrm{H}), 3.03-2.88(\mathrm{~m}, 3 \mathrm{H}), 2.82(\mathrm{~s}, 1 \mathrm{H}), 2.65(\mathrm{~d}, \mathrm{~J}=12.6$ $\mathrm{Hz}, 4 \mathrm{H}), 2.53(\mathrm{~d}, J=8.1 \mathrm{~Hz}, 2 \mathrm{H}), 2.47(\mathrm{~s}, 1 \mathrm{H}), 1.28(\mathrm{t}, J=7.1 \mathrm{~Hz}, 3 \mathrm{H})$. HPLC/HRMS (ESI): $m / z$ calculated for $\mathrm{C}_{21} \mathrm{H}_{24} \mathrm{~N}_{5} \mathrm{O}_{5} \mathrm{~S}^{+}[\mathrm{M}+\mathrm{H}]^{+}$ 458.1493, found 458.1487. $R_{\mathrm{t}}(4 \mathrm{~min}): 2.78 \mathrm{~min}$.

Ethyl 2-Formyl-4-methylthiazole-5-carboxylate (69). A solution of chloro(isopropyl) magnesium chlorolithium ( $3.60 \mathrm{~mL}, 4.68 \mathrm{mmol}$ ) was added to a solution of ethyl 2-bromo-4-methyl-thiazole-5-carboxylate $(0.90 \mathrm{~g}, 3.60 \mathrm{mmol})$ in dry THF $(5 \mathrm{~mL})$ at $-78{ }^{\circ} \mathrm{C}$. The reaction mixture was stirred for 10 min at $-78{ }^{\circ} \mathrm{C}$ before the addition of morpholine-4-carbaldehyde ( $0.90 \mathrm{~mL}, 9.00 \mathrm{mmol}$ ). After stirring for 25 $\min$, the reaction mixture was quenched with $\mathrm{NH}_{4} \mathrm{Cl}(10 \mathrm{~mL})$. The aqueous layer was extracted with EtOAc $(2 \times 10 \mathrm{~mL})$, dried over $\mathrm{MgSO}_{4}$, and concentrated under reduced vacuum. The crude product was purified by NP chromatography ( $0-20 \% \mathrm{EtOAc} /$ cyclohexanes) to give $69(495 \mathrm{mg}, 69 \%, 2.49 \mathrm{mmol})$ as a colorless oil. ${ }^{1} \mathrm{H}$ NMR ( 500 MHz , chloroform-d) $\delta 9.94(\mathrm{~s}, 1 \mathrm{H}), 4.38(\mathrm{q}, J=7.2 \mathrm{~Hz}, 2 \mathrm{H}), 2.82(\mathrm{~s}$, 3H), 1.39 (t, $J=7.1 \mathrm{~Hz}, 4 \mathrm{H}$ ). HPLC/MS (ESI): $m / z 200.0348[\mathrm{M}+$ $\mathrm{H}]^{+} . R_{\mathrm{t}}(4 \mathrm{~min}): 2.46 \mathrm{~min}$.

5-(Ethoxycarbonyl)-4-methylthiazole-2-carboxylic acid (70). 2-Methylbut-2-ene ( $7.82 \mathrm{~mL}, 73.8 \mathrm{mmol}$ ) was added to a solution of ethyl 2-formyl-4-methyl-thiazole-5-carboxylate $69(490.0 \mathrm{mg}, 2.46 \mathrm{mmol})$ in THF ( $8.20 \mathrm{~mL}, 0.150 \mathrm{M}$ ) and $t-\mathrm{BuOH}(8.20 \mathrm{~mL}, 0.150 \mathrm{M})$ at rt. After 5 min , a solution of sodium dihydrogen phosphate ( $885 \mathrm{mg}, 7.38 \mathrm{mmol}$ ) and sodium chlorite ( $734.0 \mathrm{mg}, 8.12 \mathrm{mmol}$ ) in $\mathrm{H}_{2} \mathrm{O}(4 \mathrm{~mL})$ was added dropwise to the reaction mixture. The reaction mixture was stirred for 1.5 h at rt . The reaction mixture was quenched with a sat. solution of $\mathrm{Na}_{2} \mathrm{~S}_{2} \mathrm{O}_{3}$. The aqueous layer was extracted with EtOAc, then acidified to $\mathrm{pH} 1-2$ with a solution of 2 N HCl and extracted again with EtOAc. The organic layer was dried over $\mathrm{MgSO}_{4}$, and concentrated under reduced pressure to give $70(382 \mathrm{mg}, 72 \%, 1.77 \mathrm{mmol})$ as a white powder. ${ }^{1} \mathrm{H}$ NMR ( 500 MHz , chloroform- $d$ ) $\delta 8.83(\mathrm{~s}, 1 \mathrm{H}), 4.37(\mathrm{dq}, J$ $=12.1,7.1 \mathrm{~Hz}, 3 \mathrm{H}), 2.79(\mathrm{~d}, J=3.8 \mathrm{~Hz}, 5 \mathrm{H}), 1.39(\mathrm{td}, J=7.1,5.4 \mathrm{~Hz}$, 5H). HPLC/MS (ESI): $m / z 216.0309[\mathrm{M}+\mathrm{H}]^{+} . R_{\mathrm{t}}(2 \mathrm{~min}): 1.1 \mathrm{~min}$.

Ethyl 2-((2-((tert-Butoxycarbonyl)amino)ethyl)carbamoyl)-4-methylthiazole-5-carboxylate (71). tert-Butyl N -(2-aminoethyl)carbamate ( $0.16 \mathrm{~mL}, 1.03 \mathrm{mmol}$ ) was added to a solution of 5 -(ethoxycarbonyl)-4-methylthiazole-2-carboxylic acid 70 ( 130.00 mg , 0.604 mmol ), 3-(ethyliminomethyleneamino)- $\mathrm{N}, \mathrm{N}$-dimethyl-propan1 -amine, $\mathrm{HCl}(240.4 \mathrm{mg}, 1.55 \mathrm{mmol})$, and 1-hydroxybenzotriazole $(208 \mathrm{mg}, 1.54 \mathrm{mmol})$ in dry DMF at rt . The reaction mixture was stirred for 2 days at rt . The mixture was diluted with EtOAc ( 10 mL ); washed with a sat. solution of $\mathrm{NaHCO}_{3}(2 \times 5 \mathrm{~mL})$ and water $(2 \times 5 \mathrm{~mL})$, dried over $\mathrm{MgSO}_{4}$, and concentrated in vacuo. The crude product was purified via NP chromatography ( $5-50 \% \mathrm{EtOAc} /$ cyclohexanes) to give $71(80 \mathrm{mg}, 37 \%, 0.224 \mathrm{mmol})$ as a white powder. ${ }^{1} \mathrm{H}$ NMR ( 500 MHz , chloroform-d) $\delta 7.67(\mathrm{~s}, 1 \mathrm{H}), 4.88(\mathrm{~s}, 1 \mathrm{H}), 4.35(\mathrm{q}, J=7.1 \mathrm{~Hz}, 2 \mathrm{H})$, $3.56(\mathrm{q}, J=5.9 \mathrm{~Hz}, 2 \mathrm{H}), 3.39(\mathrm{~d}, J=6.4 \mathrm{~Hz}, 2 \mathrm{H}), 2.72(\mathrm{~s}, 3 \mathrm{H}), 1.43(\mathrm{~s}$, 9H), 1.38 (t, $J=7.1 \mathrm{~Hz}, 3 \mathrm{H}$ ). HPLC/MS (ESI): $m / z 380.1197$ [M + $\mathrm{Na}]^{+} . R_{\mathrm{t}}(2 \mathrm{~min}): 2.90 \mathrm{~min}$.
Ethyl 4-Methyl-2-((2-(3-(5-methyl-1,2,4-oxadiazol-3-yl)-benzamido)ethyl)carbamoyl)thiazole-5-carboxylate (25). 4 N HCl in dioxane ( $1.08 \mathrm{~mL}, 4.31 \mathrm{mmol}$ ) was added to a solution of 71 ( 77.0 $\mathrm{mg}, 0.215 \mathrm{mmol})$ in dry dioxane $(1.08 \mathrm{~mL}, 0.200 \mathrm{M})$ at rt . The reaction mixture was stirred overnight at rt. The solvent was removed under reduced pressure to give crude ethyl 2-((2-aminoethyl)carbamoyl)-4-methylthiazole-5-carboxylate 72. This ethyl 2-(2-aminoethylcarbamo-yl)-4-methyl-thiazole-5-carboxylate 72 ( $55.0 \mathrm{mg}, 0.214 \mathrm{mmol}$ ), 3-(5-methyl-1,2,4-oxadiazol-3-yl)benzoic acid ( $52.4 \mathrm{mg}, 0.257 \mathrm{mmol}$ ), HOBt ( $57.8 \mathrm{mg}, 0.428 \mathrm{mmol}$ ), and EDC ( $66.4 \mathrm{mg}, 0.428 \mathrm{mmol}$ ) were dissolved in dry DMF $(1.07 \mathrm{~mL})$ and stirred overnight at rt . The reaction mixture was diluted with EtOAc , washed with $\mathrm{NaHCO}_{3}(2 \times 8$ mL ) and water $(8 \mathrm{~mL})$, dried over $\mathrm{MgSO}_{4}$, and concentrated under reduced pressure. The crude product was purified by RP chromatography ( $30-100 \% \mathrm{MeOH} / \mathrm{H}_{2} \mathrm{O}+0.1 \%$ formic acid) to give $25(48 \mathrm{mg}$, $51 \%, 0.108 \mathrm{mmol}$ ) as a colorless solid. ${ }^{1} \mathrm{H}$ NMR ( 500 MHz , DMSO- $d_{6}$ ) $\delta 9.16-9.10(\mathrm{~m}, 1 \mathrm{H}), 8.83-8.79(\mathrm{~m}, 1 \mathrm{H}), 8.45(\mathrm{t}, J=1.7 \mathrm{~Hz}, 1 \mathrm{H}), 8.12$ $(\mathrm{dt}, J=7.8,1.4 \mathrm{~Hz}, 1 \mathrm{H}), 8.02(\mathrm{dt}, J=7.9,1.4 \mathrm{~Hz}, 1 \mathrm{H}), 7.65(\mathrm{t}, J=7.8$ $\mathrm{Hz}, 1 \mathrm{H}), 4.30(\mathrm{q}, J=7.1 \mathrm{~Hz}, 2 \mathrm{H}), 3.52-3.43(\mathrm{~m}, 4 \mathrm{H}), 2.69(\mathrm{~s}, 3 \mathrm{H})$, $2.68(\mathrm{~s}, 3 \mathrm{H}), 1.30(\mathrm{t}, J=7.1 \mathrm{~Hz}, 3 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( 126 MHz , DMSO) $\delta$ $177.68,167.26,165.61,165.23,161.13,159.68,158.70,135.45,130.12$, $129.38,129.34,126.39,125.90,125.80,61.57,39.46$ (2C), 17.14, 14.03, 12.05. HPLC/HRMS (ESI): $m / z$ calculated for $\mathrm{C}_{20} \mathrm{H}_{22} \mathrm{~N}_{5} \mathrm{O}_{5} \mathrm{~S}^{+}[\mathrm{M}+$ $\mathrm{H}]^{+} 444.1336$, found $444.1349 . tert-Butyl (3R)-3-[[3-(5-Methyl-1,2,4-oxadiazol-3-yl)benzoyl]amino]butanoate (65). To tert-butyl (3R)-3-aminobutanoate (156.0 $\mathrm{mg}, 0.980 \mathrm{mmol}$ ) were added anhydrous DMF $(4.90 \mathrm{~mL})$, 3-(5-methyl-1,2,4-oxadiazol-3-yl)benzoic acid ( $200.0 \mathrm{mg}, 0.980 \mathrm{mmol}$ ), DIPEA $(0.51 \mathrm{~mL}, 2.94 \mathrm{mmol})$, and HATU ( $345.7 \mathrm{mg}, 1.47 \mathrm{mmol}$ ). The reaction mixture was capped and stirred at rt overnight. Water $(70 \mathrm{~mL})$ was added, and the mixture extracted with $\mathrm{EtOAc}(2 \times 60 \mathrm{~mL})$. The combined organics were washed with sat. $\mathrm{NaHCO}_{3}$ and brine, dried over $\mathrm{MgSO}_{4}$, and concentrated in vacuo to give tert-butyl (3R)-3-[[3-(5-methyl-1,2,4-oxadiazol-3-yl)benzoyl]amino]butanoate ( 335 mg , $99 \%, 0.970 \mathrm{mmol}$ ) as a clear viscous oil. Used without further purification. ${ }^{1} \mathrm{H}$ NMR $\left(500 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) \delta 8.41(\mathrm{t}, J=1.7 \mathrm{~Hz}, 1 \mathrm{H})$, $8.18(\mathrm{dt}, J=7.7,1.4 \mathrm{~Hz}, 1 \mathrm{H}), 7.95(\mathrm{ddd}, J=7.8,1.9,1.2 \mathrm{~Hz}, 1 \mathrm{H}), 7.56$ $(\mathrm{td}, J=7.7,0.5 \mathrm{~Hz}, 1 \mathrm{H}), 7.02(\mathrm{~d}, J=8.5 \mathrm{~Hz}, 1 \mathrm{H}), 4.55(\mathrm{ddt}, J=8.6,6.9$, $5.3 \mathrm{~Hz}, 1 \mathrm{H}), 2.67(\mathrm{~s}, 3 \mathrm{H}), 2.64-2.48(\mathrm{~m}, 2 \mathrm{H}), 1.48(\mathrm{~s}, 9 \mathrm{H}), 1.34(\mathrm{~d}, \mathrm{~J}=$ 6.7 Hz, 3H). HPLC/HRMS (ESI): $m / z 368.1573[\mathrm{M}+\mathrm{H}]^{+} . R_{\mathrm{t}}(2$ min ): 1.27 min .

Ethyl 4-Methyl-2-[[(3R)-3-[[3-(5-methyl-1,2,4-oxadiazol-3-yl)-benzoyl]amino]butanoyl]amino]thiazole-5-carboxylate (31). To tert-butyl (3R)-3-[[3-(5-methyl-1,2,4-oxadiazol-3-yl)benzoyl]amino]butanoate $(167.0 \mathrm{mg}, 0.484 \mathrm{mmol})$ in DCM $(1.50 \mathrm{~mL})$ was added TFA $(0.37 \mathrm{~mL}, 4.84 \mathrm{mmol})$, and the mixture stirred for 2 h at rt . Toluene was added and then evaporated followed by drying to yield (3R)-3-[[3-(5-methyl-1,2,4-oxadiazol-3-yl)benzoyl] amino]butanoic acid 67 ( 142 mg , $102 \%, 0.491 \mathrm{mmol}$ ) as colorless solid. HPLC/HRMS (ESI): $m / z[\mathrm{M}+$ $\mathrm{H}^{+} 290.11 . R_{\mathrm{t}}(2 \mathrm{~min}): 1.16 \mathrm{~min}$. To $67(140.0 \mathrm{mg}, 0.484 \mathrm{mmol})$, ethyl 2-amino-4-methyl-thiazole-5-carboxylate ( $90.1 \mathrm{mg}, 0.484 \mathrm{mmol}$ ), and $\mathrm{HOBt}(130.8 \mathrm{mg}, 0.968 \mathrm{mmol})$ in DMF $(2.42 \mathrm{~mL}, 0.200 \mathrm{M})$ was added EDC $\cdot \mathrm{HCl}(185.54 \mathrm{mg}, 0.968 \mathrm{mmol})$. The reaction mixture was stirred for 18 h at $60^{\circ} \mathrm{C}$. Water $(50 \mathrm{~mL})$ was added, and this was extracted with EtOAc $(2 \times 35 \mathrm{~mL})$. The combined organics were washed with sat. $\mathrm{NaHCO}_{3}(25 \mathrm{~mL})$ and brine $(25 \mathrm{~mL})$, dried over $\mathrm{MgSO}_{4}$, and concentrated in vacuo to give a white solid. This purified by RP column chromatography (eluent: $20-80 \% \mathrm{MeOH} / \mathrm{H}_{2} \mathrm{O}+0.1 \%$ formic acid) to yield $31(10 \mathrm{mg}, 5 \%, 0.0219 \mathrm{mmol})$ as a white powder. ${ }^{1} \mathrm{H}$ NMR ( 500 MHz, DMSO- $\left.d_{6}\right) \delta 12.55(\mathrm{~s}, 1 \mathrm{H}), 8.64(\mathrm{~d}, J=8.0 \mathrm{~Hz}, 1 \mathrm{H}), 8.44(\mathrm{t}, J=$ $1.8 \mathrm{~Hz}, 1 \mathrm{H}), 8.12(\mathrm{dt}, J=7.8,1.4 \mathrm{~Hz}, 1 \mathrm{H}), 8.01(\mathrm{dt}, J=7.9,1.4 \mathrm{~Hz}, 1 \mathrm{H})$, $7.65(\mathrm{t}, J=7.8 \mathrm{~Hz}, 1 \mathrm{H}), 4.57-4.44(\mathrm{~m}, 1 \mathrm{H}), 4.22(\mathrm{q}, J=7.1 \mathrm{~Hz}, 2 \mathrm{H})$, 2.78 (dd, $J=14.9,7.2 \mathrm{~Hz}, 1 \mathrm{H}), 2.72(\mathrm{dd}, J=14.9,6.8 \mathrm{~Hz}, 1 \mathrm{H}), 2.69(\mathrm{~s}$, $3 \mathrm{H}), 2.53(\mathrm{~s}, 3 \mathrm{H}), 1.26(\mathrm{t}, J=7.1 \mathrm{~Hz}, 3 \mathrm{H}), 1.23(\mathrm{~d}, J=6.7 \mathrm{~Hz}, 3 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( $126 \mathrm{MHz}, \mathrm{DMSO}) \delta 177.69,169.99$, 167.27, 164.66, 162.10, $159.41,156.12,135.49,130.22,129.39,129.31,126.36,125.75,113.81$, 60.45, 42.63, 41.74, 20.27, 17.00, 14.19, 12.05. HPLC/HRMS (ESI): $m / z$ calculated for $\mathrm{C}_{21} \mathrm{H}_{24} \mathrm{~N}_{5} \mathrm{O}_{5} \mathrm{~S}^{+}[\mathrm{M}+\mathrm{H}]^{+} 458.1493$, found 458.1490. $R_{\mathrm{t}}(4 \mathrm{~min}): 2.88 \mathrm{~min}$.

Propyl 4-Methyl-2-(3-(3-(5-methyl-1,2,4-oxadiazol-3-yl)-benzamido)propanamido)thiazole-5-carboxylate (32). 2-Amino-4-methyl-thiazole-5-carboxylic acid ( $2.5 \mathrm{~g}, 15.8 \mathrm{mmol}$ ), EDC $\cdot \mathrm{HCl}(3.6 \mathrm{~g}$, $19 \mathrm{mmol})$ and propan-1-ol $(23.7 \mathrm{~mL}, 316 \mathrm{mmol})$ were suspended in dry DMF ( 90 mL ) under nitrogen before $N, N$-dimethylpyridin-4amine ( $193 \mathrm{mg}, 1.6 \mathrm{mmol}$ ) was added. The mixture was heated to $65^{\circ} \mathrm{C}$ for 2 h 30 min . The solution was then cooled and partitioned between EtOAc ( 300 mL ) and water $(750 \mathrm{~mL})$. The organic layer was washed
with an aq. sat. $\mathrm{NaHCO}_{3}$ solution $(250 \mathrm{~mL})$ and brine $(250 \mathrm{~mL})$, dried over $\mathrm{MgSO}_{4}$, filtered, and concentrated in vacuo. The obtained crude was first purified by a SCX-II cartridge ( $20 \mathrm{~g}, 70 \mathrm{~mL}$ ) using MeOH and $2 \mathrm{~N} \mathrm{NH}_{3}$ in MeOH as eluents. The combined and evaporated basic residue was purified via NP column chromatography $(2-30 \% \mathrm{MeOH} /$ DCM) to give propyl 2-amino-4-methyl-thiazole-5-carboxylate (971 $\mathrm{mg}, 31 \%, 4.8 \mathrm{mmol}$ ) as a pale-yellow amorphous powder. ${ }^{1} \mathrm{H}$ NMR $\left(500 \mathrm{MHz}\right.$, DMSO- $\left.d_{6}\right) \delta 7.71(\mathrm{~s}, 2 \mathrm{H}), 4.06(\mathrm{t}, J=6.5 \mathrm{~Hz}, 2 \mathrm{H}), 2.37(\mathrm{~s}$, $3 \mathrm{H}), 1.62(\mathrm{dtd}, J=13.9,7.4,6.5 \mathrm{~Hz}, 2 \mathrm{H}), 0.91(\mathrm{t}, J=7.4 \mathrm{~Hz}, 3 \mathrm{H})$. tert-Butyl (R)-3-(Benzyl((R)-1-phenylethyl)amino)-6-((tertbutoxycarbonyl)(methyl)amino)hexanoate (80). (R)-(-)-N-Ben-zyl- $\alpha$-methylbenzylamine ( $0.45 \mathrm{~mL}, 2.14 \mathrm{mmol}, 1.6$ equiv) was dissolved in dry THF ( 5.34 mL ). The mixture was cooled to $-78^{\circ} \mathrm{C}$, $n-\operatorname{BuLi}(2.5 \mathrm{M}$ in hexanes, $0.83 \mathrm{~mL}, 2.07 \mathrm{mmol}, 1.55$ equiv) was added, and the reaction mixture was stirred at $-78^{\circ} \mathrm{C}$ for 15 min . tert-Butyl (E)-6-[tert-butoxycarbonyl(methyl)amino] hex-2-enoate 77 ( 400 mg , $1.33 \mathrm{mmol}, 1$ equiv) in dry THF ( 1.5 mL ) was added to the solution. The reaction mixture was stirred at $-78{ }^{\circ} \mathrm{C}$ for 1 h before being quenched with water. The mixture was quenched with water, extracted with EtOAc, dried over $\mathrm{MgSO}_{4}$, and concentrated under reduced pressure. The residue was purified by RP column chromatography $\left(40-100 \% \mathrm{MeOH} / \mathrm{H}_{2} \mathrm{O}+0.1 \%\right.$ formic acid). The desired fractions were filtered through a SCX-2 column, where the compound was released with a solution of $2 \mathrm{~N} \mathrm{NH}_{3}$ in MeOH to give $\mathbf{8 0}(289 \mathrm{mg}, 42 \%)$ as a colorless oil. ${ }^{1} \mathrm{H}$ NMR $(600 \mathrm{MHz}$, chloroform-d) $\delta 7.45-7.41(\mathrm{~m}$, $2 \mathrm{H}), 7.38-7.34(\mathrm{~m}, 2 \mathrm{H}), 7.33-7.30(\mathrm{~m}, 4 \mathrm{H}), 7.29-7.23(\mathrm{~m}, 2 \mathrm{H}), 3.84$ $(\mathrm{q}, J=6.9 \mathrm{~Hz}, 1 \mathrm{H}), 3.79(\mathrm{~d}, J=14.7 \mathrm{~Hz}, 1 \mathrm{H}), 3.51(\mathrm{~d}, J=15.1 \mathrm{~Hz}, 1 \mathrm{H})$, $3.35-3.28(\mathrm{~m}, 1 \mathrm{H}), 3.23-3.10(\mathrm{~m}, 2 \mathrm{H}), 2.84(\mathrm{~s}, 3 \mathrm{H}), 2.00-1.81(\mathrm{~m}$, $3 \mathrm{H}), 1.56-1.49(\mathrm{~m}, 2 \mathrm{H}), 1.46(\mathrm{~s}, 9 \mathrm{H}), 1.41(\mathrm{~s}, 9 \mathrm{H}), 1.36(\mathrm{~d}, J=7.1 \mathrm{~Hz}$, $3 \mathrm{H}), 1.33-1.25(\mathrm{~m}, 1 \mathrm{H})$. HPLC/MS: $m / z 511.6330[\mathrm{M}+\mathrm{H}]^{+} . R_{\mathrm{t}}(2$ $\mathrm{min}): 1.76 \mathrm{~min}$.
tert-Butyl (R)-6-((tert-Butoxycarbonyl)(methyl)amino)-3-(3-(5-methyl-1,2,4-oxadiazol-3-yl)benzamido)hexanoate (84). tert-Butyl (3R)-3-[benzyl-[(1R)-1-phenylethyl]amino]-6-[tert-butoxycarbonyl(methyl)amino] hexanoate $80(289 \mathrm{mg}, 0.57 \mathrm{mmol}, 1$ equiv) and $\mathrm{Pd}(\mathrm{OH})_{2}(159 \mathrm{mg}, 0.23 \mathrm{mmol}, 0.4$ equiv) were dissolved in MeOH $(2.53 \mathrm{~mL})$. Ammonium formate $(1.25 \mathrm{~g}, 20 \mathrm{mmol}, 35$ equiv) was slowly added in small amounts, and the mixture was stirred for 15 min at rt . Formic acid $(0.30 \mathrm{~mL})$ was added, and the reaction mixture was stirred at $60^{\circ} \mathrm{C}$ for 24 h . The reaction mixture was filtered through Celite, washed with MeOH , and concentrated in vacuo to give tert-butyl $(R)-3-$ amino-6-((tert-butoxycarbonyl)(methyl)amino)hexanoate 82 (140 $\mathrm{mg}, 78 \%)$ as a yellow oil. HPLC/MS: $m / z 317.2307[\mathrm{M}+\mathrm{H}]^{+} . R_{\mathrm{t}}(2$ min ): 1.03 min .
tert-Butyl (3R)-3-amino-6-[tert-butoxycarbonyl(methyl)amino]hexanoate $82(80 \mathrm{mg}, 0.25 \mathrm{mmol})$, HATU ( $144 \mathrm{mg}, 0.38 \mathrm{mmol}, 1.5$ equiv), and 3-(5-methyl-1,2,4-oxadiazol-3-yl)benzoic acid ( $67 \mathrm{mg}, 0.33$ mmol, 1.3 equiv) were dissolved in dry DMF ( 2.53 mL ). DIPEA ( 0.13 $\mathrm{mL}, 0.76 \mathrm{mmol}, 3$ equiv) was added, and the mixture was stirred at rt for 16 h . The reaction mixture was diluted with EtOAc , and a solution of $\mathrm{NaHCO}_{3}$ was added. The product was extracted with EtOAc, dried over $\mathrm{MgSO}_{4}$, and concentrated in vacuo. Purification by NP chromatography (eluant: 20-45\% EtOAc/cyclohexane) gave 84 $(102 \mathrm{mg}, 80 \%)$ as a pale yellow oil. ${ }^{1} \mathrm{H}$ NMR $(500 \mathrm{MHz}$, chloroformd) $\delta 8.52-8.39(\mathrm{~m}, 1 \mathrm{H}), 8.18(\mathrm{~d}, J=7.8 \mathrm{~Hz}, 1 \mathrm{H}), 7.97(\mathrm{~s}, 1 \mathrm{H}), 7.56(\mathrm{t}, J$ $=7.8 \mathrm{~Hz}, 1 \mathrm{H}), 4.53-4.43(\mathrm{~m}, 1 \mathrm{H}), 3.37-3.13(\mathrm{~m}, 2 \mathrm{H}), 2.82(\mathrm{~s}, 3 \mathrm{H})$, $2.67(\mathrm{~s}, 3 \mathrm{H}), 2.63-2.48(\mathrm{~m}, 2 \mathrm{H}), 1.63-1.56(\mathrm{~m}, 4 \mathrm{H}), 1.50-1.37(\mathrm{~m}$,
$18 \mathrm{H})$ (NH not observed). HPLC/MS: $m / z 525.2659[\mathrm{M}+\mathrm{Na}]^{+} . R_{\mathrm{t}}(2$ $\mathrm{min}): 1.60 \mathrm{~min}$.

Propyl (R)-4-Methyl-2-(3-(3-(5-methyl-1,2,4-oxadiazol-3-yl)-benzamido)-6-(methylamino)hexanamido)thiazole-5-carboxylate (34). tert-Butyl (R)-6-((tert-butoxycarbonyl)(methyl) amino)-3-(3-(5-methyl-1,2,4-oxadiazol-3-yl)benzamido)hexanoate 84 ( $100 \mathrm{mg}, 0.20$ mmol, 1 equiv) and potassium hydroxide ( $89 \mathrm{mg}, 1.59 \mathrm{mmol}, 8$ equiv) were dissolved in dry THF ( 1 mL ) at rt . A few drops of water (enough to dissolve KOH ) and MeOH were added, and the reaction mixture was stirred at $55^{\circ} \mathrm{C}$ for 5 h . The solvent was removed in vacuo. The residue was acidified to $\mathrm{pH} \sim 3$ with a 1 N solution of HCl . The product was extracted with EtOAc , dried over $\mathrm{MgSO}_{4}$, and concentrated in vacuo to give (R)-6-((tert-butoxycarbonyl)(methyl)amino)-3-(3-(5-methyl-1,2,4-oxadiazol-3-yl)benzamido)hexanoic acid a yellow thick oil ( 88 mg , used in the next reaction without further purification). HPLC/MS: $m / z 447.2236[\mathrm{M}+\mathrm{H}]^{+} . R_{\mathrm{t}}(2 \mathrm{~min}): 1.32 \mathrm{~min}$.
(R)-6-((tert-Butoxycarbonyl)(methyl)amino)-3-(3-(5-methyl-1,2,4-oxadiazol-3-yl)benzamido)hexanoic acid $(88 \mathrm{mg}, 0.20 \mathrm{mmol}, 1$ equiv), $\mathrm{HOBt}(53 \mathrm{mg}, 0.40 \mathrm{mmol}, 2$ equiv), $\mathrm{EDC} \cdot \mathrm{HCl}(75 \mathrm{mg}, 0.40$ mmol, 2 equiv), and propyl 2 -amino-4-methyl-thiazole-5-carboxylate ( $47 \mathrm{mg}, 0.23 \mathrm{mmol}, 1.3$ equiv) were dissolved in dry DMF $(1.31 \mathrm{~mL})$. The reaction mixture was warmed to $50^{\circ} \mathrm{C}$ and stirred for 48 h . The reaction mixture was diluted with EtOAc and quenched with $\mathrm{NH}_{4} \mathrm{Cl}$. The organic layer was washed three times with water, dried over $\mathrm{MgSO}_{4}$, and concentrated in vacuo. Purification using NP column chromatography (eluent: $30-65 \%$ EtOAc/cyclohexane, then $0 \%$ to $8 \%$ $\mathrm{MeOH} / \mathrm{EtOAc})$ to give propyl (R)-2-(6-((tert-butoxycarbonyl)-(methyl)amino)-3-(3-(5-methyl-1,2,4-oxadiazol-3-yl)benzamido)-hexanamido)-4-methylthiazole-5-carboxylate ( $82 \mathrm{mg}, 66 \%$ ) as a yellow powder. ${ }^{1} \mathrm{H}$ NMR $(500 \mathrm{MHz}, \mathrm{DMSO}) \delta 12.55(\mathrm{~s}, 1 \mathrm{H}), 8.58(\mathrm{~d}, J=8.6$ $\mathrm{Hz}, 1 \mathrm{H}), 8.44(\mathrm{~s}, 1 \mathrm{H}), 8.12(\mathrm{dt}, J=7.7,1.4 \mathrm{~Hz}, 1 \mathrm{H}), 8.04-7.97(\mathrm{~m}$, $1 \mathrm{H}), 7.65(\mathrm{t}, J=7.8 \mathrm{~Hz}, 1 \mathrm{H}), 4.46(\mathrm{~s}, 1 \mathrm{H}), 4.14(\mathrm{t}, J=6.5 \mathrm{~Hz}, 2 \mathrm{H})$, $3.22-3.09(\mathrm{~m}, 2 \mathrm{H}), 2.74(\mathrm{~d}, J=8.4 \mathrm{~Hz}, 5 \mathrm{H}), 2.68(\mathrm{~s}, 3 \mathrm{H}), 2.53(\mathrm{~s}, 3 \mathrm{H})$, $1.66(\mathrm{dt}, J=7.7,6.8 \mathrm{~Hz}, 2 \mathrm{H}), 1.49(\mathrm{~d}, J=32.6 \mathrm{~Hz}, 4 \mathrm{H}), 1.32(\mathrm{~d}, J=16.8$ $\mathrm{Hz}, 9 \mathrm{H}), 0.92(\mathrm{t}, J=7.4 \mathrm{~Hz}, 3 \mathrm{H}) . \mathrm{HPLC} / \mathrm{MS}: m / z 629.2656[\mathrm{M}+\mathrm{H}]^{+}$. $R_{\mathrm{t}}(2 \mathrm{~min}): 1.65 \mathrm{~min}$.

Propyl (R)-2-(6-((tert-Butoxycarbonyl)(methyl)amino)-3-(3-(5-methyl-1,2,4-oxadiazol-3-yl)benzamido)hexanamido)-4-methylthia-zole-5-carboxylate ( $80 \mathrm{mg}, 0.13 \mathrm{mmol}, 1$ equiv) was dissolved in dry propanol $(1.27 \mathrm{~mL}) .4 \mathrm{~N} \mathrm{HCl}$ in dioxane $(0.80 \mathrm{~mL}, 3.18 \mathrm{mmol}, 25$ equiv) was added, and the reaction mixture was stirred at rt for 3.5 h . The solvent was removed in vacuo, and the product was dissolved in DMSO $(2 \mathrm{~mL}+0.3 \mathrm{~mL})$ and purified via RP column chromatography ( $30-100 \% \mathrm{MeOH} / \mathrm{H}_{2} \mathrm{O}+0.1 \%$ formic acid). The desired fractions were filtered through a 5 g SCX-2 column, and the compound was released with a solution of $2 \mathrm{~N} \mathrm{NH}_{3}$ in MeOH to give 34 ( $45 \mathrm{mg}, 67 \%$ ) as a white powder. ${ }^{1} \mathrm{H}$ NMR $\left(600 \mathrm{MHz}\right.$, methanol- $\left.d_{4}\right) \delta 8.45(\mathrm{t}, J=1.7$ $\mathrm{Hz}, 1 \mathrm{H}), 8.16(\mathrm{dt}, J=7.8,1.4 \mathrm{~Hz}, 1 \mathrm{H}), 7.97-7.93(\mathrm{~m}, 1 \mathrm{H}), 7.59(\mathrm{t}, J=$ $7.8 \mathrm{~Hz}, 1 \mathrm{H}), 4.63-4.53(\mathrm{~m}, 1 \mathrm{H}), 4.18(\mathrm{t}, J=6.5 \mathrm{~Hz}, 2 \mathrm{H}), 2.85-2.79$ $(\mathrm{m}, 2 \mathrm{H}), 2.77-2.70(\mathrm{~m}, 2 \mathrm{H}), 2.65(\mathrm{~s}, 3 \mathrm{H}), 2.55(\mathrm{~s}, 3 \mathrm{H}), 2.45(\mathrm{~s}, 3 \mathrm{H})$, $1.80-1.63(\mathrm{~m}, 6 \mathrm{H}), 1.00(\mathrm{t}, J=7.4 \mathrm{~Hz}, 3 \mathrm{H}) .{ }^{13} \mathrm{C}$ NMR ( 151 MHz , $\mathrm{MeOD}) \delta 179.01,172.35,169.26,168.98,164.47,162.75,157.79$, 136.78, 131.06, 131.00, 130.30, 128.57, 127.29, 115.93, 67.35, 51.61, 48.56, 42.32, 35.45, 32.88, 26.15, 23.17, 17.33, 12.10, 10.81. ## Author Contributions

${ }^{\nabla}$ These authors contributed equally.

## Notes

The authors declare the following competing financial interest(s): All authors who are, or have been, employed by The Institute of Cancer Research are subject to a Rewards to Inventors Scheme that may reward contributors to a program that is subsequently licensed. The Institute of Cancer Research has a commercial interest in the development of inhibitors of HSET.

## - ACKNOWLEDGMENTS

The authors acknowledge funding from Cancer Research UK program Grant C309/11566; the healthcare business of Merck KGaA, Darmstadt, Germany (CrossRef Funder ID 10.13039/ 100009945); and the Institute of Cancer Research. S.L. and K.D. are also supported by Breast Cancer Now (Grant CTR-Q3). The authors thank Dr. Amin Mirza, Dr. Maggie Liu, Meirion Richards, Katia Grira, and Joe Smith of the Structural Chemistry team for their expertise and assistance; Dr. Michael Carter and Gary Nugent for cheminformatics assistance; Dr. Francesca Wood for the mouse plasma stability study; and Dr. Hans-Peter Buchstaller, Dr. Daniel Kuhn, Dr. Joachim Albers, and colleagues at the healthcare business of Merck KGaA, Darmstadt, Germany (CrossRef Funder ID 10.13039/ 100009945) for helpful discussions and their interest in this work.

## - ABBREVIATIONS USED

4N, noncentrosome amplified DLD1 cell line; 4NCA, tetraploid centrosome-amplified DLD1 cell line; ADP, adenosine diphosphate; Alexa-488, (2-(3-amino-6-imino-4,5-disulfoxanth-en-9-yl)-5-[5-(2,5-dioxopyrrol-1-yl)pentylcarbamoyl]benzoic acid); ATP, adenosine $5^{\prime}$-triphosphate; DAPI, $4^{\prime}$,6-diamidino-2-phenylindole; Cy5, (2Z)-2-[(2E,4E)-5-[1-(5-carboxypentyl)-3,3-dimethyl-5-sulfoindol-1-ium-2-yl] penta-2,4-dienylidene]-1-ethyl-3,3-dimethylindole-5-sulfonate; DCM, dichloromethane; DIPEA, $N, N$-diisopropylethylamine; DMF, dimethylformamide; DMSO, dimethyl sulfoxide; EDC, 1-ethyl-3-(3(dimethylamino)propyl)carbodiimide; ESI, electrospray ionization; HATU, 1-[bis(dimethylamino)methylene]-1H-1,2,3-triazolo[4,5-b]pyridinium 3-oxide hexafluorophosphate; HBA, hydrogen-bond acceptor; HBD, hydrogen-bond donor; HCl , hydrochloric acid; HOBt, hydroxybenzotriazole; HSET, human spleen, embryo, and testes protein; IEDDA, inverse electron demand Diels-Alders; $K_{\text {Sol }}$, aqueous kinetic solubility; LC-MS, liquid chromatography-mass spectrometry; LE, ligand efficiency; LLE, lipophilic ligand efficiency; MBD, microtubule binding domain; MT, microtubules; MTOCs, microtubule organizing centers; NP, normal phase; RP, reverse phase; rt, room (ambient) temperature; SAR, structure-activity relationship; TCO, trans-cyclooctene; TFA, trifluoroacetic acid
